THREE WARNINGS.

A SICK STOMACH—AN ACHING HEAD—AND CONSIDERABLE GENERAL DEBILITY, ARE THOSE WARNINGS WHICH IT IS MADNESS TO DISREGARD, DANGEROUS DISEASES MAY BE EXPECTED TO FOLLOW THEM IF NOT ARRESTED WITHOUT DELAY. TO KEEP THE RE AND STOMACH CALM THE EXCITED BRAIN, INVIGORATE THE NERVOUS SYSTEM, AND REGULATE THE BOWELS, with TARRANT'S SELTZER APERIENT IF YOU WISH TO ESCAPE THE EVILS WHICH THE PREMONITORY SYMPTOMS INDICATE. HOW MANY CONSUMING FEVERS, VIOLENT BILIOUS ATTACKS, NEVROUS PARAXYSMS, AND OTHER TERRIBLE AILMENTS MIGHT BE PREVENTED IF THIS AGREEABLE AND INCOMPARABLE SALINE TONIC AND ALTERATIVE WERE ALWAYS TAKEN IN TIME! SOLD BY ALL DRUGGISTS.

AMERICAN VOLCANOES.

Interesting Notes on Those of Northern California, Oregon, and Washington Territory.

Arnold Hague and J. P. Iddings in American Journal of Science for September.

During the autumn of 1870 the geologists attached to the geographical exploration of the fortieth parallel made a preliminary reconnaissance of several of the extinct volcanic cones of northern California, Oregon, and Washington territory, for the purpose of planning detailed investigations of the principal volcanoes of the Sierra and Cascade ranges. A further study of these volcanoes however, was never undertaken, and although the explorers brought back most interesting geological and lithological material, the results and observations of the work have never been published, with the exception of an announcement in this journal for March, 1871, of "the discovery of actual glaciers on the mountains of the Pacific slope," and a popular paper on "The Volcanoes of the United States Pacific Coast," read by Mr. S. M. Emmons before the American Geographical society, March 13, 1877.

Among the more prominent peaks along this belt of volcanic cones may be mentioned Lassen's peak and Mount Shasta, in California, Mount Pit, Three Sisters, Mount Jefferson, and Mount Hood, in Oregon, and mounts St. Helens, Adams, Rainier, and Baker, in Washington territory. From this long line of volcanoes the geologists of the fortieth parallel survey selected for the purpose of exploration the four peaks which, from their size, position, and geological relations, might be taken as typical of the chain. Mr. Clarence King explored the two great cones of California; at the same time Mr. S. F. Emmons undertook the examination of Mount Rainier, while Mount Hood was visited by one of the writers of the present article. The collections which they made at that time were deposited in the cabinet of the survey.

Lassen's peak is situated in California just north of the fortieth parallel of latitude, where continuity of the bold crest of the Sierra Nevada range breaks down and is replaced by lower and less regular ridges. From Lassen's peak this magnificent chain of volcanoes extend northward at irregular intervals for nearly five hundred miles. The principal volcanoes follow in general the axial lines of the Sierra and Cascade ranges, breaking out either along the main line of upheaval or a short distances to the westward. Volcanic extrusions along fissure lines and flows of lava of greater or less extent unite the main peaks, forming a nearly continuous belt of igneous rocks.

Mount Rainier is the grandest of all the volcanoes of the northwest, and forms the most prominent topographical object in Washington territory, rising proudly above all other peaks, and towering far above the crest of the Cascade range, which lies about twenty miles to the eastward. The surface features of the western portion of the territory have been greatly modified by the great lava flows of the volcano, and no less than four important rivers of the territory rise among the glaciers of the mountain—the Nisqually, Puyallup, and White rivers, which flow into Puget sound, and the Cowlitz, which, running in a southwesterly direction, pours into the Columbia. Snow and ice cover the top of the volcano, reaching downward for 5,000 or 6,000 feet, while with the most marked contrast the broad base of the mountain supports a dark, dense forest vegetation of great grandeur. The summit of Mount Rainier is formed by three peaks, the highest situated to the eastward of the other two, and separated from them by deep and inaccessible gorges, although they attain within a few hundred feet of the same altitude. The main peak presents a perfect, circular cone, with a crater about a quarter of a mile in diameter. The altitude of the peak as determined by the United States coast survey is 14,444 feet.

Mount Hood is situated directly on the crest of the Cascade range, about twenty-five miles south of the Columbia river. It has an altitude of 11,225 feet above the sea level, rising about six thousand feet above the main range, but the long lava flows extending in every direction from the base of the volcano have buried beneath their mass nearly all remnants of preexisting rocks. Mount Adams and Mount St. Helens, on the north side of the Columbia river, form with Mount Hood a triangle the area of which has been the center of great volcanic activity. The summit of Mount Hood is a single peak, a portion of a rim of an ancient crater, opening to the south. The crater is about one-half a mile wide from east to west, the encircling wall for three-fifths of the circumference rising 450 feet above the snow and ice which fills the basin.

None of the volcanoes along this belt occupy so comparatively isolated a position as Mount Shasta, which stands upon an open plain, with the neighboring hills and ridges many thousand feet lower. The great range of the Sierra has fallen away, and is followed by low, obscure ridges, confused and broken up by volcanic outbursts. The altitude of Mount Shasta is given at 14,440 feat above sea-level, and as the neighboring ridges rarely attain an altitude of over 3,000 feet, the volcano presents an imposing spectacle, surpassed by few mountains in the world. As seen from the west the volcano presents a double cone, with the smaller built upon the flanks of the larger one, and about 2,000 feet lower. The main cone possesses a very regular outline, with remarkably steep slopes of uniform angle. Around the broad base of Mount Shasta numerous lesser cones have broken out, offering a great variety of volcanic phenomena. One of these, which has been named Little Shasta, rises to more than 3,000 feet above the neighboring valley. Seventy miles southeast of Mount Shasta, not far from the boundary between Nevada and California, occurs Lassen's peak, lying, as already mentioned along the direct line of the Sierras, where the granite of the main range has been abruptly broken down. The region has been the seat of great volcanic activity lasting through long periods of time, the present mountains forming but a remnant of former extrusions, and so far as geological interest is concerned is probably unsurpassed by any other mountain. Lassen's peak, however, is by no means as conspicuous an object as many of the volcanoes, being surrounded by other cones of considerable elevation, all of them rising out of a great volcanic table. The altitude of Lassen's peak is given at about 10,500 feet. It is a broad, irregularly-shaped mountain, with four prominent summits, and abundant evidences on the slopes of comparatively recent excursions of lava.

As the rocks brought back may be considered as representing the principal types of the ejected lavas from the different flows, a large number of thin sections have recently been prepared for the purpose of comparative study with the volcanic rocks of the Great Basin, and their microscopic examination has been followed up by chemical investigation. While a cursory examination of these rocks shows certain special characteristics in color, habit, and form of crystals which in many cases easily identifies hand specimens with one or the other of the volcanoes, a comparative study of their mineralogical, structural, and chemical features shows the closest identity in the nature of the ejected material from the four volcanoes. In their lithological characters they possess so many features in common that a general description might be given which would be applicable to them all.

First Class Insurance.

Insure with *Thomas' Eclectric Oil.* It is the cheapest and best method of insurance we know of. By its use you are sure to escape many grevious aches and pains. Policies are obtainable at all drug stores in the form of bottles at 50 cents and $1 each.

A TROY PARROT.

The Remarkable Bird Which Dwells in a New York Village.

Troy Times.

Four years ago a bird was brought from the cost of Africa by a sea captain, who gave it to his sister in this city. He need not be definately located, but we can put our finger on him and day, only it isn't a safe thing to do, unless the careful approach of the finger is accompanied by the warning, "Dont you bite," which the parrot will repeat as distinctly as you say it. and will refrain from biting—if he knows you. It is not known whether he is five or fifty years old. That is one of the very few things he keeps to himself. On all other subjects he is wonderfully communative and his information, like his vocabulary, is vast and various. He is not a green parrot—no, indeed, not much—but a gray parrot, described in the "American Cyclopædia" as, of all parrots, "the most remarkable for its docility and power of articulation." If the book means our bird, he is, indeed most remarkable for these very qualities. Since his arrival in this city—Linnæus, by the by, classes the gray parrot as "Psittacus erythacus," and however it my be with our bird about the erythacus, there is no doubt whatever that he has become quite a psittacus—he has depended for his education almost wholly upon his own efforts, Till quite lately he has lived almost entirely in the kitchen of a restaurant, where, with a colored cook who loves him and colored waiters who adore him, he has picked up more food than accomplishments. But with a good ear, a retentive memory, fairly good reasoning power, and, certainly, the power of an apt association of words with things, with elocutionary gifts that are really remarkable, he has acquired a quite advanced education, that makes his friends wonder what a year or two in the Hartford high school might do for him. With no teaching he can, and does, distinctly repeat every one of the orders called down to the kitchen—such as "coffee breakfast for one" (or two, three, or four, as the case and call may be); "beefsteak rare" (or done) "for one," and so on through the entire list of usual calls. It is a fact, duly attested by credible witnesses, that, the other evening, when the order was "tea supper for one," the parrot instantly said: "Make it ham and eggs with a cup of coffee!" We shall not soon forget the large-eyed look of utter incredualty with which a young lady received this story from The Times reporter. With heretofore implicit confidence in everything he said, she never will believe a word he says again. But the story is true, nevertheless.

Within a year past we have considerbly changed our ideas about the actual power of parrots. What they repeat is not altogether mechanical and merely by rote. It is pretended that they know the meaning of all the words they say. But they associate certain words with certain things. No one disputes that they have memory, and if they have that they think, and, to some degree, they reason. Thus this bird, a few days ago, as was duly chronicled in The Times, flew away from home. An advertisement in The Times restored him to his owner. The boy who brought him back said: "Your bird knows only one word" (in point of fact he knows nearly as many as the boy does), "and that is 'Kehoe.'" Now "Kehoe," which is almost a bird note, and would be easily uttered by a less accomplished parrot, is the name of the cook who fed the bird, and to whom the bird is much attached. And during the three days of his exile among strangers who caught him, he called constantly for "Kehoe." He wanted his friend; he "wanted to go home;" he knew what he was talking about.

Since his return he has been removed to a higher sphere than the kitchen from which he escaped, and he has a larger field in which to display his accomplishments. And without special instruction he daily adds to his vocabulary. He says "Good morning," and says it in the morning, not afternoon. "How do you do?" "How's your wife?" "How's your folks?" "I see you there," "What are you doing there," "Peek-a-boo," in various tones of voice; and he whistles and laughs inimitably, after a fashion of his own. This very brief catalogue covers but a few of his accomplishments. And he has a quality rare with good talkers—he is equally a good listener, and a most attententive and appreciative one. If you talk to him for an hour at once, he will not open his mouth, but will keep his eyes on you, bend his head to listen, apparently anxious not to loose a word, and an hour after, or the next day, he will have something to say on the same subject. He is remarkable among very remarkable birds.

Enterprise Always Tells.
