

Toyland on Third Floor of Teachers College Vies With Santa's Workshop

Preparatory Instructors Live Days of Childhood Glories Once Again as Fashion Dolls of Many Varieties

Toyland has been discovered! It is on the third floor of Teachers college of the University of Nebraska. The catalog calls it the laboratory of Education 6. Santa Claus' own workshop could never be more fascinating for it is here that student teachers learn the handicrafts and industrial arts which they will teach their primary pupils in a few years.

Here dolls come to life. Hug-gable, lovable dolls are created from rags and stockings, from corn shocks and cobs, from spoons and wire, even from paper bags and from nuts. And no one would believe the number of wonderful toys that can be made from spoons. And many shelves of the cabinets lining the laboratory walls are devoted to spoon toys.

Ceeds Love Dolls

It is no wonder that the ultra-modern, ultra-sophisticated ceeds bend over their toy-making with alert eyes with interest. Their own favorite Annabellas and Gwendolyns have been lying in dusty trunks for ten or fifteen years but

with puppies and pigs and bunnies. Care and artistic ability evolved these dolls but ingenuity and originality have seen possibilities in more common materials. A cardboard face pasted at the top of a twisted twig makes it one version of the "crooked man who walked a crooked mile to find a crooked sixpence against a crooked stile."

Red Riding Hood Appears

Red Riding Hood is made entirely from corn husks except the two corn-silk braids hanging over her shoulders. A painted food matches her painted red coat with its red shoulder cape.

One man doll is made from corks and wire and another from acorns. With white cotton for a wig an artistically lady in full skirts is now evolved from a paper bag.

Many Kinds of Dolls

Beautiful soft dolls are made from old white stockings stuffed with cotton. Faces are painted on and yarn or embroidery-floss hair hangs in braided pig-tails or long curls. Blondes and brunettes they are created. Some have pale cheeks and others are heavily rouged.

"Dutch" and "Raggedy-Ann" bobs are both popular. Cuddly baby dolls are dressed in gingham rompers, gingham printed

snuggles his cardboard head up against the lanky spoon neck of a brightly painted giraffe. A dining room table and chairs are made from painted spoons sked out with cardboard. Oil stoves, ranges, and gas stoves for doll houses can be made from spoons, too, and are there on the shelves.

Any second grader would be proud of a necklace made by herself. The student teachers learn how to teach their little pupils to string bright berries, painted seeds or corn kernels in patterns as attractive as glass beads.

Toy making is not taught only for the fun of making toys. Industrial art has very definite aims. These are posted just inside the door of the laboratory where they are constantly called to the mind of the future teachers. They are:

1. A project must be worth while from the standpoint of child development.

2. It must make the child think

and find out.
3. Encourage working together.
4. Make child intelligent and sympathetic regarding conditions of production (limited extent.)
5. Utilize every chance to teach oral and written English, reading, arithmetic, hygiene.

3. Fat spoons and slim spoons, big spoons and small spoons, straight spoons and lumpy spoons; spoons for silk and spoons for cotton, and spoons for thread and spoons for yarn, papa spoons and mama spoons and baby spoons, even aunt and uncle spoons are all turned into such an array of toys that they crowd each other from the cabinet shelf.

Students Build Locomotive

Small spoon-wheels on wire axles are attached to a big fat spoon and pointed brown to make a locomotive. A very tiny spoon nailed to the top forms its miniature smoke stack. Behind this engine trail spoon cars painted red and brown plainly lettered "C. D. & Q."

"Spark Plug" shod with spoons,

with pupils and pigs and bunnies. Care and artistic ability evolved these dolls but ingenuity and originality have seen possibilities in more common materials. EAST CAMBRIDGE

Dayton whip-steel SPEED

gives you the jump on faster players

Look at the lines of a Dayton Steel Racquet. It's built like an airplane, built for speed. The frame is shaped like a strut, thin edge to the wind. The steel strings are like guy wires—less than half the thickness of gut, much stronger, more springy.

The wind resistance of a Dayton Steel Racquet, measured in the wind tunnel of an airplane laboratory, was 45% lower than that of standard wood-and-gut racquets.

That extra energy is imparted to the ball, and gets it there faster, 20% faster. And that extra 20% gives you the jump on speedier players.

In impartial scientific tests, the Dayton comes out ahead in the laboratory, just as it does in practical tests on the courts. Payton Steel Racquet Co., Dayton, Ohio.
