These obstacles seem to have operating in France, in which a self-propelling trolley runs along at a speed corresponding with that of the vehicle to which lamps should be dispensed with. it supplies current. The trolley is driven

by a small three-phase induction motor, supplied with current generated by the motor of the vehicle. Two metal wheels making contact on the feed and return wires constitute the trolley carriage. The trolley is driven at a speed slightly greater than that of the vehicle, the small excess of speed The surface contact electric rallway sys-tem installed at Monte Carlo, the famous f resort in the principality of Monaco, has been running now for about three years and is undoubtedly the most extensive and most successful surface contact electric rallway in the world. The route is on very hilly ground, and the length is about five and one-half miles. As in other systems of this type the current is taken by the car from contact blocks between the tracks by means of lor_ shoes or skates carried under the car tody. The contact blocks are kept alive by section switches placed in manholes near the track. The blocks are dead except when the car is passing. There are other engineering peculiarities of the system and willo the devices used are somewhat com-plicated three years of satisfactory opera-tion would indicate that success has been achieved. being absorbed by the slip of the motor, the slip between the friction wheels and motor and the slip of the trolley wheels. The carriage is not essentially different from the ordinary electromobile. In Germany, where the prejudice against tracks in the streets | ground, and trolley wires overhead is decided, another useful combination has been made. At Hanover the cars run as ordinary trolley cars in the suburba, but as soon as they reach the city line the trolley is tied down and the car is run by storage batteries. The car is in reality an electromobile omnibus. fitted with a trolley and flanged wheels in addition to its equipment of accumulators. the would indicate that success has been achieved. The consensus of opinion with regard to the financial side of electric power for shop service is that electric motor installations are money-savers. The friction of long lines of main shafting and sometimes of subsidiary shafting is avoided, and this represents a substantial portion of the total power ordinarily consumed. This offer re-duces the amount of power required to do a certain quantity of work astonishingly. In one instance recorded it was only 20 per cent of the actual fated motor equipment of the shop, while in another it barely ex-ceeded is per cent of the shop capacity, even though in this the power necessary for an electric crane had been included as well as that required for lighting. In a large Philadelphia locomotive works, with electric motors in service requiring collec-tively 2500 horsepower, the generator ca-pacity provided is only 1.550 horsepower. Of this a 50 horsepower in service, it has been estimated that one-third of the rated motor capacity will usually he amole In running on tracks the flanged wheels in chieved. front are let down to serve as guide wheels and keep the vehicle on the track. When the vehicle leaves the tracks for the road these wheels are lifted up and the trolley fastened down, and so it becomes an ordinary electromobile. The vehicle carries four mators of four-horse power each, and weigns all told about 14,000 pounds. Of this the battery represents about 3,300 pounds.

Care of Hello Girls.

Telephone girls are exceedingly well cared for by the great telephone companies in the east. They are well fed within the exchange and provision is made to insure their getting the maximum amount of rest that their free time will allow. Beyond this the girls go through a regular fire drill every week. has been estimated that one-third of the rated motor capacity will usually be ample This is a wise precaution against fire risks.
