After 40 Bowel trouble is Most Dangerous

Constipation may easily become chronic after forty. Continued constipation at that time of life may bring attacks of piles-and a host of other disorders.

Watch your bowels at any age. Guard them with particular care after forty. When they need help, remember a doctor should know what is best for them.

"Dr. Caldwell's Syrup Pepsin" is a doctor's prescription for the bowels. Tested by 47 years' practice, it has been found thoroughly effective in relieving constipation and its ills for men, women and children of all ages. It has proven perfectly safe even for babies. Made from fresh, laxative herbs, pure pepsin and other harmless ingredients, it cannot gripe; will not sicken you or weaken you; can be used without harm as often as your breath is bad, your tongue is coated; whenever a headachy, bilious, gassy condition warns of constipation.

Next time just take a spoonful of this family doctor's laxative. See how good it tastes; how gently and thoroughly it acts. Then you will know why it has become the world's most popular laxative. Big bottles-all drugstores.

Sicux City Ptg. Co., No. 39-1930

OF INTEREST TO FARMERS

OUST THE LAGGARDS. There are three things a dairy-man can do to make his herds more profitable: Cull the low producers; end the others according to what they can produce when well fed; then breed intelligently. Studies by the bureau of dairy industry, United States department of agriculture, of the production, feed cost and income records of cows on test in dairy herd improvement associahave shown that the elimination of the lowest producers from the dairy herd not only increases the average production per cow, but always results in increasing the cash income over cost of feed per cow. Therefore, if any dairyman is dissatisfied with the income which he makes over cost of feed, he can always increase that income per cow by culling a little closer. At present, when the surplus of dairy products in this country is abnormally high, and when prices are correspondingly low, closer culling is one of the ways of getting better results immediately. It is not recommended that there be a sudden elimination of 30 per cent of our dairy cows. To get rid of so many cows all at once would demoralize the dairy industry and would cause a milk famine. The and would cause a milk famine. The sudden culling of 20 per cent of our dairy cows is not recommended for the same reason. It probably would not be wise to recommend the culling of any particular per cent at this time, but rather to recommend that the dairymen of this country should cull their herds closer and closer, and not stop culling until they have brought production and consumption into proper balance. However, to bring about such an ideal state of affairs, the dairyman mat have production, feed cost, and income records of his cows. How is he going to get such figures? One of the most practical ways to get such information, at a cost he can afford, is through the work of the dairy herd improvement associations, or similar organiza-tions of dairymen. A dairy herd im-provement association is an organization of about 26 dairy farmers who co-operatively employ a man to test their cows for economical production of milk and butterfat. One day each month the tester weighs the feed, both concentrates and roughages, for each cow in the herd; weighs her milk and tests it for butteriat; and figures out the gross income and income over cost of feed for each cow. From the record of one day per month he computes the record of the individual cow for the month and for the year, and by comparing the pro-duction records of the daughters of each bull with the production records of their dams, he passes an accurate judgment upon the actual breeding value of the bull. Thus the farmer in the association knows, at all times, what every cow in his herd is producing. Knowing the amount of production and the cost of feed, he is able to cull the low and unprofitable producers without guesswork. He is able to feed the rest of his cows according to their capacity for profitable production: Thus he increases his prof-

its. Also, he is able to use the records in such a way as to breed his herd up toward higher production, instead of down toward a lower and less profitable production per cow. The dairy herd improvement associations are growing rapidly in numbers and influence all over the country, and the national dairy associations have recently worked out and adopted herd test plans by which it may be possible to bring about a very rapid im-provement in our dairy herds. PROFIT AND LOSS
There's a heap of hunches on better farm management practices

in the summary of farm account books kept by one of our leading farm bureau agents. Of the 18 farmers whose accounts are summarized, 13 made money; five lost money. The net profit of the 13 ranged all the way from \$175.96 to \$3,468.75. The average of the 13 was \$822.37 The per cent return on investment of the 13 money-makers was all the way from 3 per cent to 54 per cent
—only three of the 13 being below
6 per cent and 10 of them 8 per cent or better. The farmer whose net return on investment was 54 per cent had 64 per cent of his to-tal farm receipts from livestock and 36 per cent from crops; one whose net return on investment was 49.5 per cent had 44 per cent of his to-tal income from livestock; another whose net return on investment was 37 per cent had 73 per cent of his receipts from livestock. The man whose return on investment was 54 per cent had 45 acres of corn that per cent had 45 acres of corn that made 48 bushels per acre; 17 acres of silage that made seven tons per acre; 18 acres of kafir that made 22 bushels per acre; no wheat; 12 acres of oats, 19 bushels per acre; no horses—tractor used for power; two dairy cows; 77 hens. Total farm expenses, \$1,301.50; crop acres, 111. Hired labor, \$122.50; feed bought, \$675.95. Receipts per crop acre, \$23. \$675.95. Receipts per crop acre, \$23.-98. There are several interesting facts about the five farms that lost money. The owner who fared worst had 166 acres of wheat. Another loser had 215 acres of wheat; another had no crops—he was a poultry farmer with only 215 birds.

RISKS IN VACCINATION It is timely to remind swine prolucers that varcinating hogs for the prevention of cholera is not with-put certain hazards that must be eliminated in so far as possible if pest results may be expected, says an expert. We say this in spite of the expert. We say this in spite of the well known, frequently-demonstrated fact that potent serum and virus properly administered will immune a hog against hog cholera. What we have in mind is vaccinating under conditions as they are frequently found in hog lots, and not under idea conditions. Many times hogs

FILLING THE SILO. To tramp or not to tramp? That s a question quite a few farmers are asking about silage. It is now generally agreed that tramping is not necessary except—and get this point—except when the corn is too dry to pack well. Corn put in after it has become dry following frost will need either wetting or tramping. Filling the silo and squirting water on top of the silage won't do. Improvements in farm machinery and equipment make it possible to fill the silo with considerably less labor and a smaller crew. The modern ensilage cutter does not require

have been vaccinated with serum and virus when they were not in condition to respond favorably to the action of the immunizing agencies. By this we mean that hogs are affected with diseases other than cholera, or with parasites, to the extent that producing a mild case of cholera as is done in double treatment (serum and virus) is not without certain hazards. Serum and virus will have no influence whatever in preventing or curing any other disease than hog cholera and it will only prevent cholera, not cure it Because of this, correct diagnosis in a herd that appears to be infected with cholera, is very important. To vaccinate a herd diseased with something other than cholera fre-quently results in disappointment to the owner and worst of all some loss of faith in vaccination. This is all wrong. Veterinarians called upon to vaccinate herds of hogs that are out of condition because of some infection other than cholera should point out to the owners the probable uncertainties of vaccination under such conditions. On the other hand, they should also eagerly point out the positive certainties of vaccinat-ing healthy herds. All this argues much for immunizing weanling pigs rather than delay until shotes may be out of condition when an out-break of cholera in the community is imminent.

If you ever left your automobile near the barn door with a window or two open, you undoubtedly found it well filled with flies in a short time. There seems to be something about the glass and the warm con-dition of the car that invite flies. The though occurred to us that it

CATCHING FLIES

might be a good practice to take an old automobile body and place it near the barn and use it as a fly catcher. Some method could be devised for killing fine flies, either by spray or by poison. If a fly catcher could be arranged so as to catcher and the arranged so as to catch could be arranged so as to catch as many flies as the automobile does, it would not be a difficult job to destroy them in large numbers. Flies are not only a nuisance about the barn and house, but they cause considerable distress to cattle. Maybe some one who is already a genius in making contraptions around the farm, has already made a fly catcher similar to the automobile top. If they have, we would be pleased to receive a description and a photograph of it. It would be well worth trying to arrange a fly catcher simi-lar to the automobile body for catch-ing flies as we believe it would be a

good way to reduce them. Of course, it is always in order to keep the barnyard and other places where flies may breed free from manure and decaying refuse. Hauling ma-nure direct to the field and spreading it will assist materially in reducing the fly population.

DAY DREAMING Did you ever sit and dream about something you would like very much to have? Did you ever build air castles, queries the embryo philo-sopher and then proceeds to answer. Of course, you have. Guess everybody does more or less. Is it a new home you are planning? A trip to foreign lands? A new barn? Riches and weath? A pure-bred herd of the kind of cows that combine type and production? Some folks call it day dreaming. A few might even be inclined to sneer if you let them know your thought. But we don't think it's so foolish. We like to call it by another name—vision. Men with vision have built empires, have built giant industries, have given to the world great discoveries and inventions. Yes, day dreaming is essential to the progress of civilization. Riding a plow, milking cows, sewing, driving a binder, making hay, all these tasks and hosts of the country day specific representation. other every day ones, offer splendid opportunities to exercise your imagination, to day dream, if you please.
And doesn't it make you happier,
don't you get a lot of joy out of the
process? We do. Who knows, if you
wait, if you work, some day the
dreams may come true.

PRODUCE ONLY BEST Perhaps we are getting at the wrong end of the problem, when we commence running down the other fellow's product—condemning what some one else produces, and saying very little about our own product. If we would produce a higher quality product, we wouldn't have to be expect a market for a low quality ashamed to advertise it and we would get ahead a lot faster. In selling whole milk they have spectors come around. Today it is very noticeable how the bacteria count per c. c., has dropped. We are learning to produce low bacteria milk. Why not the same with cream, which gets spread over the country a lot farther than milk. How can we expect a market for a low quality product? Not only that, but the high and low quality products get mixed together, and consequently we have inferior dairy products which usually sell at a low price. No one has ever made money marketing low quality products, declares a leading dairyman who produces only the

WHY THIS BOY STAYED With Dad and me it's half and half; The cow I own was once his calf. No town for me, I will not bolt, because my horse was once his colt. I'm going to stick right where I am because my sheep was once his lamb. I'll stay with dad—he gets my vote because my hog was once his shoat. It's fifty-fifty with dad and me a profit sharing company.

WHY THIS BOY LEFT
I left my dad, his farm, his plow, because my calf became his cow. I left my dad—'twas wrong of course, because my colt became his horse. I left my dad to sow and reap, because my lay had to sow and reap. because my lamb became his sheep. I dropped my hoe and stuck my fork, because my plg became his pork. The garden truck I had to hoe was his to sell and mine to grow.

tractor or motor can be used to run the cutter. Two men comprise the crew that easily puts in 15 loads of fodder a day. How does your daily record compare with this?

THAT CONCRETE FLOOR Some poultrymen have raised a question as to whether or not concrete floors are all right for poultry houses. When properly built this type of floor is satisfactory. Concrete put on the ground will absorb considerable of any available moisture. It is therefore highly essential to insulate a concrete floor

How One Woman Lost 20 Pounds of Fat

Lost Her Double Chin Lost Her Prominent Hips Lost Her Sluggishness Gained Physical Vigor Gained in Vivaciousness Gained a Shapely Figure

If you're fat-first remove the

KRUSCHEN SALTS contains the 6 mineral salts your body organs glands and nerves must have to function properly.

When your vital organs fail to per form their work correctly-your bowels and kidneys can't throw off that waste material—before you real ize it—you're growing hideously fat:

Try one half teaspoonful of KRUSCHEN SALTS in a glass of hot water every morning—in 3 weeks get on the scales and note how many pounds of fat have vanished.

Notice also that you have gained in energy—your skin is clearer—your eyes sparkle with glorious health—you feel younger in body—keener in mind. KRUSCHEN will give any fat person a joyous surprise.

Get an 85c bottle of KRUSCHEN SALTS from any leading druggist anywhere in America, (lasts 4 weeks). If this first bottle doesn't convince you this is the easiest, safest and surest way to lose fat—if you don't feel a superb improvement in health—so gloriously energetic—vigorously alive—your money gladly returned. that waste material-before you real

Road Mars Beauty of

Famous Mont St. Michel Modern vagabondism has its good is well as bad points. It was to failitate access to Mont St. Michel, on the Normandy coast, that the high oncrete dike, running from Pontorson for a mile and a half, was built, instead of the galloping horses which used to drive pilgrims and tourists to the famous abbey at low tide along a natural sand bank, one now sees endless rows of cars running side by side with a small train. It is much nore convenient, as one can go or leave the place at any hour. However, that high unsubmersible wall has had a disastrous effect on the beauty of the site. The sands grad- the forests of the dominion, includually rose about the coast, soon ing the accessible raw materials, preading above the water mark, and the thrifty sheep herders, realzing the quality of the short salty sum is, it covers only a part-possigrass that grew there, led their ani- bly no more than half-of the total mals farther and farther away. The economic stake which the Canadian coast is continually altering and people have tied up in one way or ruining the isolation of that strange another in forest resources, industry cocky island on which the old gothic and trade. abbey is built. It has finally been decided to cut off the dike at the most favorable spot and build a bridge over the gap. Then the sea is expected to draw the sands so that the Mont will be freed from them.

BEWARE of TOO LOW consumption of Motor Oil . .

Small consumption of motor oil may mean that the oil is not working up into the cylinder walls-that also, it is not lubricating the bearings sufficiently.

This is most likely to happen in a new motor with snug-fitting parts that are not worn -- if your oil is too heavy.

For this reason be sure that you use new Polarine of the most suitable grade. Only high quality oil of the right grade can give protective lubrication—can prevent wear and loss of power.

New Polarine lubricates efficiently at all engine temperatures -deposits least carbon-resists dilution. It is the safe oil for year 'round use in all types of motors.

Consult the new Polarine Chart—at Red Crown Service Stations and Dealers everywhere in Nebraska-25c a quart.
