Ralph Beckwith says that the snow bird is properly named the "snow bunting." Other names are given such as snowflake, snow lark, snow bird, white bird and white snow bird. There are no snow white snow birds. In the winter the snow bunting is white with upper parts stained with black marking. Snow buntings seem to enjoy the cold weather and only in the depth of winter do they drift down into the northern part of the U. S. Sometimes they drift as far south as the gulf coast but the first sign of spring will send them back across Canada to areas little known. Their food consists of small seeds, pig weeds, rag weed and all kinds of grass, and they come south to find food as they feed almost exclusively from the ground. They stay in flocks from a dozen to several hundred.
