By an accumulation of wire as a cord about a horseshoe bar of iron, the power is increased locally to attract the

blow on the bell is reduplicated. A similar electro-magnet in the shutter indicating the room from which

the call came. Simple designs for controlling the temperature in houses heated by steam, practical value in the saving of fuel, and in the added comfort of evenlyheated rooms. In each room an automatic thermometer is placed, which makes a contact as soon as a required point of temperature is reached.

It is so arranged that the contact sunshine. Expectancy of repulse is the they become entirely deaf. They felt electro-magnetically cut off the supply of heat from the chamber. As the failures. Fear of bankruptcy has up- tack of typhoid. They have been room cools when the temperature falls torn many a fine business and sent the troubled for weeks with some below the required limit, the thermom- electricity. A great part of the energy fertilizer is a very powerful one; in eter breaks the circuit and the heat is

This thermostat is made by riveting side by side two strips of different maexpand at different degrees of heat.

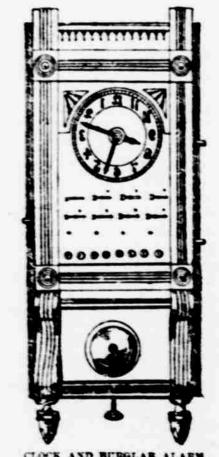

MOTOR FOR DOMESTIC USE.

This enables a contact to take place at any temperature within the reanired limits.

From the combined use of the thermostat and electric bell, a fire alarm could be arranged.

An electric door opener has also been invented. The action of the door in closing compresses a powerful spiral spring, which is held in check by a lever until the lever is freed by an electromagnetic impulse. The spring forces the door open, the latch being at the same time withdrawn. Electric clocks are in common use in public buildings where a timepiece is required in all or several rooms. Of these there are two distinct classes; one has a centralized government, where one standard clock drives all the others electro-magnetically, while in the other system each elock is a free and independent timekeeper. These clocks are electrically wound, and when science can furnish an inexhaustible electrical supply, the action of the electric clock will be the nearest approach to perpetual motion yet made. The advantages of incandescent electric light are well known

and need no mention. This lamp emits so little heat that it is especially appreciated in warm weather, and when broken is in no danger of causing fire. By having a spare lamp in each room under control of the burglar and fire alarm system any disturbance in either would produce

not only the stroke of an alarm bell but would instantly light the whole house. The number of practical possibilities and actual applications of electric power | mercial-tiazette. in housework through the electric motor is almost unlimited.

The motor is compact, silent clean. In domestic sizes of one horse power, it weighs less than 100 pounds and the simple turning of a switch will start or stop it. By its use electrical power is made available. Its principle is entirely magnetic. The pull that a wire, conveying an electric current, is seen to exert upon a compass needle is intensified by having a large horseshoe electro-magnet for the compass needle, and many turns of wire close up within its grasp. The revolving cylinder is an electric treadmill by which the current is cut off from each wire in turn as it reaches the point of most powerful attraction, so that the current is always

kept advancing toward the magnetic pole, but never reaches it. These motors are now on the market in a variety of shapes and sizes. In size they vary from one-tenta one horse power upward. The weight of a motor of one-eighth one borse power is about

Its pulleys deliver power when it is in any position, resting on its side or bottom side up. The magnet is subject to no wear; the bearings of the armature show change and have to be renewed. Summer Protection from Animals and By the use of the motor the danger from steam pipes and boilers is avoided, but it has peculiar dangers of its own. In wiring a building for electrical apparatus, the wires should be hidden, jet

Great sums are paid those solved in the past.

ones. If this should ever prove prace Poultry World. tical electricity would overstep the limits of the useful arts into the moral art of keeping peace in families.

The most satisfactory results of the use of the motor in domestic affairs must necessarily be in apartment buildings where several families live in close proximity. Many of the difficulties in the way of its common use in private families will be overcome when that era of perfect housekeeping called cooperative shall have dawned. When that time comes women will

find time to plan new devices and the servant girl be a memory of the past. If electricity does not supply the actual manna by which the human race shall be fed, it will doubtless be a powerful factor in supplying the increasing needs of our increasing population. It enters not only into every line of labor which takes heavy burdens from the shoulders of overworked men and women but by its increasing utility child labor in factories should and will be done away with. The ordinary yearly consumption of wheat for the countries of the world "Mr. Weber, this is your son's photo- usually embraced in such statistics aggraph which he ordered. Does it not gregates about 2,100,000,000 bushels- sure, but they are willing to take 400,000,000 in Europe and 700,000,000 the risk-you ought to be glad in other countries. A survey of the probable production the current year indicates an aggregate of about 1,838. 000,000 bashels. If the deficiency in production were more evenly distributed than it is the shortage would have little significance. As it is, it calls for an unusual movement from surplus to importing countries, thuadding more than ordinarily to the cost.

Paper Crowding Out Wood. Paper is fighting wood hard in the manufacture of boxes, buckets and even packing-cases, and so perfect is the manufacturing process that in many instances nothing but the wonderful difference in weight can afford a clew to the presence of paper in the manufacture. Paper packing-cases are indestructible, apparently, and the saving they effect in freight is enormous Thousands of dollars are already inrested in this comparatively new industry, and a new company with \$1. 250,000 capital has been organized to introduce paper-boards into other lines. Experiments have been made with buggy wagons and other things where lightness is needed, and paper floorings in lieu of boards will soon be heard of. It is easy to render the material fireproof in course of its construction, and this is an additional advantage that is
