

FORTY MILLION CAKES YEARLY.

THE PROCTER & GAMBLE CO., CHICAGO.

Weather Bulletin.

(Copyrighted, 1895, by W. T. Foster.)

ST. JOSEPH, Mo., June 22—My last bulletin gave forecasts of the storm waves to cross the continent from 25th to 29th.

The next will reach the Pacific coast about June 29th, cross the western mountain country by close of 30th, the great central valleys from July 1st to 3d and the eastern states about the 4th.

Average rains may be expected through the central portions of the United States, leaving a deficiency in the extreme north and south.

Warm wave will cross the west of the Rockies country about June 29th, great central valleys July 1st and the eastern states July 3d.

Cool wave will cross the west of Rockies country about 2d, great central valleys 4th and eastern states about 6th.

This cool wave will inaugurate an extended cool period and what is here designated as the cool half of the month.

Each month is usually divided into about two weeks of cool and two weeks of warm weather, and the difference in the average temperature of these two periods is almost universally of a radial type.

It is of great importance to know when these warm and cool periods will occur.

Each of these twelve to fifteen days warm periods has two storm waves, two warm waves and two cool waves, and each of the twelve to fifteen days cool period has the same.

Most rain falls during the cool periods, and the evaporation and drought symptoms are experienced during the warm periods.

I challenge the world in making long range forecasts of these warm and cool periods, and whoever tests the accuracy of these bulletins in forecasting these periods will find the forecasts, in that respect at least, wonderfully correct.

The rain belt for July appears to extend from Denver to Philadelphia, leaving large areas of drought in the direction of Charleston and Key West and from Chicago and Davenport toward the northwest.

General forecasts for July and temperature forecasts for the coming winter will be published in my next bulletin. I believe my calculations for the coming winter to be reliable, and they are of a most important character. It will be a remarkable winter as to temperature.

Phosphorescence increases at low temperatures. Very many articles shine of their own light after being charged with electricity and placed in a temperature 180 degrees below zero.

Among these are milk, cotton, wool, paper, leather, linen, tortoise shell, soda, sponge, the yolk of an egg, etc. Dark bodies produce more light than light colored bodies.

An article in the Meteorological Journal says that the initiatory movements of the cyclones that pass over the North American continent originate in the Japan current of the north Pacific between America and Asia.

Not long ago these orthodox meteorologists declared that our storms are all organized in and east of the Rockies, and therefore claimed that our storms do not reach the Pacific coast from the west as stated in these bulletins.

Heat one end of a wire and currents of electricity will flow through the other part of the wire, and this may be tested as follows: Place a magnetic needle above the cool part of the wire, the cool end being inserted in the earth, and the needle will place itself at right angles to the wire, proving the presence of electric currents. These currents are formed only as the wire heats or cools, and not when the heating is stationary.

As much as possible, all work, more especially mental work, should be avoided in damp, foggy, threatening weather. Nine-tenths of the serious errors in judgment occur in such weather. The weather described occurs as the low barometer comes in. The mind is much clearer under a high barometer and the best thoughts flow, the grandest deeds are accomplished in clearing weather when the clouds have rolled away.

If more attention were given this subject most of the serious errors would be avoided. Merchants may notice that their greatest sales are made under a high barometer, physicians have noted that they are called to visit the sick more frequently while a low covers the country, and the harvest of undertakers follows a low barometer.

It is very difficult to reason ourselves into an acceptance of the wave theory of light and the vibration theory of sound. Ordinary common sense would lead us to see that these vibrations are only results of light and sound, and not the cause.

Yet the scientific world has completely surrendered to the wave theory. We may next expect the proof that it is the mill that runs the water and that we have been mistaken in supposing that the water runs the mill. We must change our views as to the windmill and say that the mill operates the wind, and not that the mill is operated by the wind.

If the report of an explosion should jar and break the window panes in our houses, we must say that the window panes caused the vibrations and the sound. In fact, if any sound goes out through the atmosphere we must say that the atmospheric waves cause the sound, while our smothered inner conscience tells us plainly that it is the sound that causes the atmospheric waves.

Light, being a force, does not, then, cause the waves in the ether, but the waves cause the light. All this nonsensical dose has been prescribed for us by scientific doctors, and of course we will swallow it.

Prof. Dewar stands at the head of the scientific societies of Europe. He says that oxygen is highly phosphorescent. That means that under certain conditions oxygen will give off a steady light similar to that of the glow-worm. The gas is charged with electricity and then passed into a vacuum tube, where it gives off a comet-like phosphorescent light.

This is another suggestion as to the origin and nature of light. The proportion of oxygen increases nearer the earth's surface and so does the intensity of light. As we ascend in the atmosphere, light and the proportion of oxygen to other gases decrease in nearly the same ratio. Along with these facts we may perceive that the force which radiates from the sun in straight lines comes in contact with Oxygen of our atmosphere, and this combined action ignites the carbon gases, producing light.

DID NOT COUNT 'EM.

A German Passenger Loses His Child in a Peculiar Way. From the Chicago Inter-Ocean. A few weeks ago, on an east-bound Pennsylvania train, of which I had charge, were a fussy German couple with seven children. They all got on at Chicago, and were destined to a small town on the line in Indiana.

The family occupied three seats in the fore part of one of the first-class coaches. The children ranged from 3 to 17 years of age, and were a noisy lot of kids. In addition to the children the party had about 300 pounds of hand baggage, consisting of valises, boxes and bird cages. When we reached the station where they were to get off I was at the head of the train and saw the brakeman help them off. After the train started I commenced to go through the cars.

When I came to the coach where the German family had been holding forth I found a little boy about 5 years old crying as if his heart would break. When I asked him the cause of his trouble he said his papa and mamma had got off the train and left him. I immediately pulled the bell cord and stopped the train.

We had not run more than half a mile from the station where the Germans had left the train, and I started one of my brakemen back to the station with the child. He had got just around a bend in the track when the old German was seen coming up the track at a furious gallop, waving his hands frantically in the air.

When he met the brakeman with the boy he declared that the conductor was trying to steal his child, and would not confess that in getting off the train he had lost a kid by failing to count heads, and had not missed it until after the train had left the station.

His head was tangled. And the Mistaken Identification Was Not at All Pleasant. "My dear, dear old boy!" began the effusive young man as he entered a Woodward avenue car and slapped a middle-aged man on the back, "but I was just thinking of you a moment ago! How do you do, anyway?"

"I am well, sir," frigidly replied the man as he turned full around. "Ah! Beg pardon for my mistake. I was certain it was my dear old friend, Col. B."

"I said I was well," repeated the man who had been slapped. "Yes, I know, and I beg you to excuse me. It's the first time I ever made such a mistake. The resemblance is wonderful."

"Did you wish to speak to me, sir?" demanded the other in tones about 45 degrees below zero. "I slapped you on the back by mistake. I am sorry for it. You look like the twin brother of my old friend Col. B. and I mistook you for him. Sorry—very sorry, and I hope you'll overlook it."

THE CHIEF

Published Weekly. Subscription, - \$1 Per Annum Invariably in Advance. If not paid in advance, after this date March 15, 1895, the price will be \$1.25. Entered at the Post Office in Red Cloud, Neb., as mail matter of the second class.
