

### WhenFoodSours

Lots of folks who think they have "indigestion" have only an acid condition which could be corrected in five or ten minutes. An effective anti-acid like Phillips Milk of Magnesia soon restores digestion to normal.

Phillips does away with all that sourness and gas right after meals. It prevents the distress so apt to occur two hours after eating. What a pleas ant preparation to take! And how good it is for the system! Unlike a burning dose of soda-which is but temporary relief at best-Phillips Milk of Magnesia neutralizes many times its volume in acid.

Next time a hearty meal, or too rick a diet has brought on the least dis comfort, try-

#### OF INTEREST TO FARMERS

WINTER KILLING OF WHEAT While, as every grower of winter wheat knows, there is no way of absolutely insuring this crop against winterkilling, there are some things that can be done to at least partially protect the crop against loss from this source. The matter of first im-portance is the variety. The Tur-key wheats and their derivatives are comparatively hardy. Iowa 440, Kanred, Iobred and Ioturk are all

hardy varieties for Iowa conditions. The variety having been deter-mined, the matter of next importance is seed bed preparation. Wheat requires a finely pulverized seed bed, fine on top yet one that is well compacted below the surface. wheat follows small grain and the ground has been plowed, he disk should be freely used and be fol-lowed by a corrugated roller, if pos-sible. The more compact the seed bed, provided the top surface is fine and mellow, the more quickly will the seed sprout. Rapid growth at this time means a more vigorous stand before coid weather begins. It is also generally recognized that there is less danger of winter killing when the ground has been well compacted.

Then again, the amount of plant food in the soil is considerable im-When the soil is well stocked with plant food, growth will be rapid from the start, thus insuring strong, sturdy plants to go through the winter. Keeping the soil well stocked with organic matter, as well as with phosphorus and potassium fertilizers, is important. Where lime is needed it should be supplied so that legumes will do their utmost in supplying organic matter. The latter not only aids the soil to hold more water, but it also furnishes food for the soil bacteria which, in turn, aid in converting insoluable plant food in the soil into soluable food. While early seeding of wheat is advantageous, in sections where the Hessian fly did some damage this year, seeding should by all means be deferred till after the fly free date. If this is some damage this not done the spring brood of the fly is practically certain of taking a heavy toll from the crop next year. Observe the fly free date wherever necessary.

CLEAN SEED, SAVE YIELD Weeds are the most dangerous enemies of crop yields, year in and year out. Yet, year after year, thous-ands of acres of valuable small crops are planted with uncleaned, bin run seed. The resultant loss in yield, grade and quality of grain to-tals many millions of dollars an-nually. No farm operator would deliberately sow weed seed, but this is exactly what happens when bin run seed is planted. There can be a large percentage of weed seed in grain without it being especially noticeable. The same grain run through a fanning mill or recleaner, however, will yield a surprisingly large amount of weed seed, cracked and light kernels, and other imperfect seed grains. One of the most valuable items of farm equipment, from the standpoint of the cash return on the investment, is a good fanning mill or recleaner. When equipped with the proper screens and operated at the correct speed, a fanning mill is capable of doing a and grading. There are a number of different types of recleaners which may be used. Some are operated by air blast alone, some by sieves and screens and others by a combina-tion of all three. Another type, the disk separator, has different size pockets or cells in the sides of revolving disks. This type is especially efficient in regions where there is a high dockage content in the grain and where the dockage is practically the same diameter as the seed grain, making screen sepa-ration difficult.

BREAKING UP BROODY HENS In this age of secialization there is very little need for a broody hen on the average farm. Her specialized job is to lay eggs, and eggs and more eggs. The job of hatching these eggs and of caring for the baby chicks thus hatched has been turned over to the incubators and brooders. As a consequence, when biddy takes a notion to revert to type and try hatching a few of her own eggs most poultrymen take a determined stand against such activity. Many times the problem of breaking up a broody hen is not so simple as just deciding that she is not to be allowed to sit, however. In breaking up broody hens it is inadvisable to try to starve the hen into abandoning her mothering instincts. Neither is it advisable to duck her head in water as a cure. The best step to take is to shut her in a crate that is placed in a comfortably warm, well ventilated building. This crate should have a slat bottom and should not be provided with lit-ter or any material which might be scratched into a pile for a nest. Once the hen has been placed in this sort of a crate do not forget to feed her. If a broody hen is fed a well balanced ration and fed plenty of it she is more likely to improve physically and to store up vitality for another laying period, which she would not do if improperly managed. Another point to bear in mind is that it is much easier to break up a broody hen if the attempt is made when she first shows signs of broodiness than it is after she has been sitting for two or three

TREAT CABBAGE SEED

The dreaded black-leg disease of cabbage claimed the entire 20-acre field of cabbage from one grower last season. With cabbage selling at \$20 to \$25 a ton and the average yield of from 8 to 10 tons an acre, this loss is enough to make a grower sit up and take notice, especially when the loss could easily have been avoided. Cabbage black leg is carried in the seed and therefore is more difficult to control through treatment than if the organism were carried on the outside of the

VALUE OF SANITATION

Most grownups recognize the desirability of personal cleanlness and of common sense sanitation in their homes and places of business. It is more comfortable to be clean after one has reached maturity and too inconvenient to suffer the expensive ills that result from insanitary surroundings. When it comes to their poultry, however, that is quite a different story in all too many in-stances. The same man who would recoil in horror from a filth encrusted dish placed before him on his table allows his fowls to eat and

seed. The only effective control worked out by scientists is the hot water trea ment whereby the seed is immersed for 25 minutes in water heated to a temperature of 122 degrees Fahrenheit. Even with this treatment there will be a loss in germination of from 10 to possibly 25 per cent because old seed and seed of low vitality will be entirely killed. Any grower would be willing to take that loss in seed germination if he could be reasonably sure that the organism in the seed was controlled. Any grower, by using a little care, can hot water treat his cabbage seed at home. Fill a wash boiler full of water and heat to 122 degrees, using two tested water thermometers, one thermometer to check on the other. After the water reaches 123 degrees the wash boiler is removed from the The cabbage seed is loosely coarse cheesecloth bags, about half a pound to the bag, after which it is suspended in the hot water for 25 minutes. Five pounds of seed may be treated at one time where a large quantity of water is used. Surplus water heated in the teakettle and held in reserve in case the water temperature falls under 121 degrees. After the seeds have been treated for 25 minutes they are removed, dipped in cold water to cool, and spread out to dry. It would be advisable to hot water treat the seed just previous to planting, then allow it to dry so as to facilitate easy sowing either by hand or with the seed drill.

MOST IMPORTANT ACRE

One sadly neglected and very valuable acre or part of an acre which properly cared for, will yield the largest net return of any cn the farm is the vegetable garden. Valuable, in that it returns a large cash return per acre. Valuable, in that it provides healthful and tasteful food for the family table. Valuable in that it provides a reliable source of without the family table. of vitamins for the daily diet, a health requirement for working men and women and growing children City dwellers are annually purchasing a greater amount of vegetables while people in the country usually find it cheaper and more convenient to raise their own. The vegetables raised and used from even a small garden during a season would cost the average family at least \$50 if purchased at a store, while thousands of farm housewives, especially those who can many quarts of vegetables each summer, secure annual return of two, three or four times that amount. The shadow of the hoe handle has stood between many a farm table and the vegetable garden. But by proper arrangement of a garden the necessary cultivation can be done by wheel hoes or even horse drawn tools by the man of the house without cutting in an undue amount on the field work. Long rows are easier to cultivate than short ones and even if this requires more space than formerly used for the garden, the land used is much cheaper than the labor connected with hard hoeing a smaller garden "patch." In this way a supply of vegetables for canning as well as summer table use can be raised with no extra labor while many garden crops can be dried or stored in a cellar for winter use.

"CHARM" IS RIGHT

I'm eighty, by gravy, but spry as a baby, a sort of a sport in my way; And Maria has itched ever since we ben hitched fer the sight of a bright cabaret. But what with the battle with crops and with cattle, and slavin' and savin' all day, with c.ose calkilation fer Joe's eddication—it seemed we wuz out here to stay. But when he got preachin', and Jenny was teachin', sez I to Maria, "Hooray! we're steppin' doggone it, so get on your bonnet, we're heading for Reading, P-a.!"
Well she tried to forbid it, but, by heck, we did it, we et in a peppy caf-ay, we heard the first-raters in the theayters and we're back the farm now to stay. We wuz on the farm now to stay. We wuz there fer a fortnight, and I wuz a sport, right, jest a-bunin' our carnin's away; out when we'd saw plenty of shows—mebbe twenty—and odd bills called "vawdvilles," real gay, with radio-ringin', and lady-show singin', and fiddlin'-jest middlin', I'd say—and fast enter-tainment, I ast when the train went, and we're back on the farm now to stay. The eats wuz for wim-men, the meats wuz all trimmin'. jest a mite of a bite on a tray. My stummick got achin' fer hog jowl and bacon, or even a real meal of hay; I'd ruther see egg shows than any blame leg shows, the high gauge at my age don't pay; there's a kind of a charm to the grind on a farm—and it aint sich a bad place to stay.

CLOVER CULTURE

While it is true that red clover will grow very nicely on soils that are slightly acid, the fact should not be overlooked that it will do much better on a soil that carries an abundance of lime. It will pay to lime acid soils for red clover as has already been demonstrated by many farmers, but it isn't so necessary as it is for alfalfa and sweet clover. These two legumes simply refuse to grow on soils that are even only slightly acid. It is a waste of money to sew alfalfa and sweet clover on soils that show an acid reaction according to test. If you are in doubt about the condition of your soil and its ability to grow a big clover orop, have it tested for soidity. Your county agent will be glad to do this for you. The day is set to do this for you. The day is at hand when guesswork on the farm is too expensive. Know the condition of your soil with reference to acidity; for it is easily found out.

TWO ESSENTIALS

If there are any fundamental principles of agriculture, they consist in thorough tillage and plenty of barnyard manure.

are in the poultry yard instead of a dining room; he will howl his head off if Junior tracks a little mud onto the living room rug, but he will allow droppings, decomposed food material and other offensive litter to accumulate in his henhouses until they smell to high heaven. He is scrupulously careful about the lawns near his house, but his chicken yard looks like that lower corner of the "south forty" after the last batch of city picnickers had done their worst to it. Then he wonders why his fowls are such poor laws. why his fowls are such poor layers, look so droopy and dispirited and so readily take on all the ills that chicken flesh is heir to.

Resort Guests Gamble

on Direction of Wind

The management of one of the hotels at a well-known seaside place which figures as a winter resort has devoted a huge wall space in the lobby to an illuminated weather vane that flashes the exact range of the veering flaw, as it blows now north, now south. Daily, crowds cluster about this weather clock and watch the little lights flicker the slightest turn of the vane as it ticks off the

slightest wind whimsy. The more ingenious guests (on rainy days) have invented a mild form of roulette and gamble on which light will show next, or how many times "north" is apt to flash on as against "northwest"; "south," as against 'southwest," etc. Broken-hearted boys who have played a losing game against the elements have been known to rush out in the rain, after espepecially heavy losses, and drown their sorrows .- Washington Star.

Probing Facts of Fatness

The hereditary of fatness, but of mice not human beings, is undergoing investigation at Leland Stanford university. Dr. C. H. Danforth of the department of anatomy, points out in the Journal of Hereditary that yellow mice are almost always fatter than their gray, white or spotted brothers or sisters. They are not only fatter but seem to have much greater resistance and ability to survive on a restricted dlet than their skinnier confreres. It seems probable, says the scientist, that the fat is stored in a manner to make it readily available in time of need. Further studies are in progress to ascertain the ratio in which the mice that are fat and yellow transmit their qualities to their offspring.

The charm of a bathroom is its spotlessness. By the use of Red Cross Ball Blue all cloths and towels retain their whiteness until worn out .- Adv.
