

Below, by fencing your field into several areas with temporary electric fences, your cattle will eat a greater portion of the forage. When you turn cattle into an entire field at one time, a lot is wasted by trampling. By rotating your grazing between and within pastures you will be able to increase the life of your stand and get more pounds of beef and milk from an acre. Rotational grazing can increase milk production 10% to 20% over continuous grazing.

A good fertilizer and lime program is a must if you want to get top pasture yields and high quality forage. Cattle will generally eat properly fertilized forage with greater relish since it is more palatable. Besides you will be able to turn cattle on topdressed pastures about a week to ten days earlier. Your soil tests are a good guide for topdressing. They help you fit applications of lime and fertilizer to the particular need of your soil.

Spraying for spittlebug can increase yields by 50% during years when they are heavy in your forage. It will usually pay to spray if you inspect your field and find an average of one bug on the first 40 or 50 plants you look at. Apply two quarts of 25% emulsion concentrate mixed with ten gallons of water per acre before the pasture gets more than six inches high. If pasture gets over six inches tall you had better use 20 gallons of water in place of the usual ten gallons per acre to get good coverage.

**4-way action
saves you money**

Insist on

Carbola
disinfecting white paint

1. Paints a clean white
2. Kills many disease germs
3. Keeps cobwebs down for months
4. Kills flies

● One easy spraying of CARBOLA gives dairy barns, poultry houses, hog pens—and home cellars—important **profit protection**. Carbola gives a whiter and lighter interior. Contains strong disinfectant to kill disease germs causing tuberculosis, bronchitis, chicken and hog cholera, and mastitis. Carbola keeps cobwebs down for months — kills flies, fleas, lice and mosquitoes—and used as a dust, Carbola neutralizes ammonia fumes.

More for your money with Farmhand!

You won't find better haying equipment than Farmhand. It's priced to save you money . . . designed to cut field time and effort and give you better hay. Talk to your Farmhand dealer today.

FARMHAND'S NEW MODEL 25 WHEEL RAKE costs at least \$100 less than most other rakes—yet rakes cleaner, offers more features. Rakes full 7' swath; five independent raking wheels closely follow ground contours as spring steel teeth gently pick up all the hay and ease it into fluffy windrows. Model 25 can be offset so tractor wheels do not pass over unraked hay. Can also be used as windrow turner. Exclusive hand crank simultaneously lowers (and raises) all raking wheels to proper raking pressure and into transport position. There's no PTO, gears, belts, pulleys or ratchets to wear out or give trouble.

BEAT THE WEATHER WITH A FARMHAND HAY CONDITIONER

FARMHAND F-96 HAY CONDITIONER costs less, gives you features not found on some higher-priced machines. You can quickly and precisely adjust (1) roller spacing, (2) roller tension and (3) ground clearance. Heavy duty gear box and drive parts are protected by slip clutch. Special studded steel rollers crush stems for fast drying, without clipping or shattering rich top leaves. Rolls designed to avoid plugging and wrapping. Optional rubber top roller is available.

IF YOU PREFER A CRIMPER, the Farmhand-Oppel Model 80 is low priced and rugged as they come. Steel angles on large diameter rolls mesh precisely to crimp hay for rapid, even curing. Model 80 has roller spacing and tension adjustments, plus a crank for quick clearance adjustment. Optional gauge roller prevents scalping on rough terrain. Windrow wings optional.
