

When these pullets are housed they're going to be put under stress. The less you disrupt their routine, the less problems you'll have when you get them into the laying house. New pullets should be vaccinated and wormed at least three weeks before they are housed. This gives them time to recuperate and get back to normal. When housed, clean, well-ventilated conditions will help reduce stress. Also, your feed dealer can give you tips on how antibiotics can help offset stresses during housing.

as management improves — STRESS Retreats

It takes healthy flocks to give you peak winter egg production. Mrs. Alfred Nielsen, of near Defiance, Iowa, has been getting about 80% production during winter from the 750 layers in this house. If the flock starts showing signs of disease, she puts a stop to it immediately by making adjustments in management. Note the ventilating fan covered with wire mesh at her left. Good ventilation plays an important role in preventing CRD and other respiratory problems.

Here's a flock that has been provided a good environment. You'll note the windows can be adjusted to vary natural ventilation as weather conditions change. As a result, the litter is dry, loose and clean. Also, there's plenty of feeder and waterer space. Hens need about five inches of feeder space each. Otherwise four feeders, each five feet in length, will supply enough space for each 100 hens in a house. These should be spaced so birds won't have to walk over 10 to 15 feet to get to feed. Also, make sure water fountains are placed close by.

\$1.49 VALUE PLEWS FISTOL-GRIP OILER

with the purchase of this special 12-tube carton of

TERRAMYCIN® FOR MASTITIS

Brand of oxytetracycline HCl

Get this rugged, durable Plevs Oiler. Piston-controlled trigger releases a stream or just a drop of oil. Sturdy nickel-plated steel spout gets into even hard-to-reach places.

Enter the Terramycin Checkstakes at your supplier's today . . . you may win \$25,000

You'll get this rugged Plevs Oiler—packed right in the box—when you buy this special 12-tube carton of Terramycin for Mastitis.

The only all-liquid broad-range mastitis preparation you can buy

It stands to reason only an all-liquid mastitis product has what it takes for faster action and cleaner milk-out. And, Terramycin is the only broad-range mastitis treatment you can buy that's completely dissolved in its liquid carrier . . . ready to go to work the minute you treat. This fast action means surer results and less damage to valuable milk-producing tissues.

Once Terramycin has done its job . . . it milks out clean and completely as only a liquid can. There are no antibiotic residues when used as directed. And, it has no penicillin. Yet no drug or antibiotic fights more mastitis-causing organisms—year after year—than Terramycin. Make it your treatment of choice for dry and milking cows.

Mastitis lowers milk production and reduces profit—so make sure your mastitis control program is a sound one. Warning: milk taken from dairy animals within 72 hours after the last treatment for mastitis must not be used for food.

See your animal health supplier now—and get your special 12-tube carton.
