To Tell a Horse's Age.

Every horse has six teeth above and below. Before 3 years old he sheds the middle teeth. At 3 years he sheds one more on either side of the central teeth. At 4 he sheds the two corner and last of the fore teeth. Between 4 and 5 years the horse cuts the under tusks, at which time his mouth will be complete. At 6 the grooves and hollows begin to fill up a little; at 7 the grooves are well nigh filled up, except the corner teeth, leaving little brown spots where the dark brown hollows formerly were. At 8 the whole of the hollows and grooves are filled up. At 9 there is often seen a small bill to the outside corner teeth, the point of the tusk is worn off and the part that was concave begins to fill up and becomes rounding; the squares of the central teeth begin to disappear and the gums leave them small and narrow at the top.—Exchange.
