SEE WHY COPPER-CLAD RANGES DO NOT RUST OUT

A section of a range body is heated and there on the iron body is the sweat from the asbestos. Right before your eyes you see just exactly what happens every time you build a fire in your range. You see why the sheet of copper is used and what it does and how it does it. You take nobody's word—you see—you know—absolutely, positively.

SAVE A THOUSAND SHOVELS OF COAL EVERY YEAR

You know how the many walls and air spaces of a thermos bottle hold the heat. You know that a house with a single wall is not as warm as the house with two walls and an air space. You know that storm windows, two windows with a space between, are much warmer than a single window even if it is as thick as the two windows.

The Copper-Clad Range has four walls and an air space. See what it means in fuel saving. See the water sizzle and boil away on the 3-ply sample

Copper-Clad means that Pure Sheet Copper is placed BETWEEN the sweaty asbestos and range body. To place it elsewhere would be like climbing on top of a roof to get out of the wet.
