ARITHMETIC BY MACHINERY.

enisville, Ky., Mun's Remarkable Invention.

The stereotyped remark about some of our modern machinery having almost human intelligence gains new force as the result of the invention of a Louisville man. A. C. Schuman, of 560 ---- street, that city, has been granted patents on an adding machine that computes all four sums in arithmetic-addition, subtraction, division and multiplication.

Mr. Schuman has already gained more than local distinction by his invention in the field of applied mechanics.

The manipulation of the invention involves no mental arithmetical calcution to assist in the working. The process is as nearly a mechanical operation as possible.

The adding machines now in use are built for processes of addition alone. It is possible, however, to use them for simple subtraction. When Mr. Schuman, some time ago, turned his attention to computing machinery he invented two machines.

One of these is an adding machine and typewriter combined, suitable for making out itemized bills and the like. This machine which was the first one patented by Mr. Schuman, only computes sums in addition.

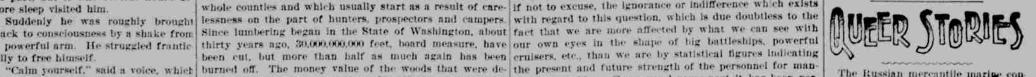

The machine which is available for all our processes of computation is limited as to typewriting facilities. The change from one form of calculation to another means only the shifting of a bar and the turning of a crank se many times.

The odd part of this uncanny machine is that it computes sums in five or six figures more quickly than the shorter ones. This is due to the mechanical construction. In division the fractional remainder is always set down with the answer.

"I applied for patents on both machines at about the same time, but the letters on the simple machine were granted first," said Mr. Schuman, "The machine which computes all sums was invented before the other."

Mr. Schuman is assisted by his son George Schuman. Between them they have done some remarkable work. For the Nazareth Academy Mr. Schuman furnished a planetarium and a telescope. The planetarium shows the position of all the inner plants for the century just closed, recording transits and eclipses. The telescope, which has an equatorial mounting, is an unusually good one.

Another of Mr. Schuman's achieve ments, says the Louisville-Courlet Journal, was made in the line of cog and thread cutting machinery. He has built a machine which will cut any required number of cogs on a wheel of any given dimension. The threadcutter can be adjusted so as to cut from 100 threads to the inch to one thread in 12 inches, on a rod one-quarter of an inch in diameter. Only a mechanic can appreciate the importance of these nachines or the difficulties surmounted
