AGRICULTURAL, Rotation of Crops, It has long been a settled fact in agriculture, that the greatest return from the soil is generally secured, not by continuing growing one plant, even though it command the highest market price.

land—in manuring and improved methods of culture. While the average production of wheat in America is less than fifteen bushels per acre, in the old and long cultivated districts of England the average is nearly three times what it is in this country.

Fourteen tests should be preferred; but never," he says, "try to raise pigs from a sow with less than ten good tests. Avoid breeding in-and-in."

From the Valley Farmer, Selecting Seed Wheat, Farmers sustain great loss in not bestowing proper care and attention in the selection of the most productive varieties of wheat for seed, and in not cleaning it thoroughly from rye, cheat and other foul seed.

Does All Sound Move At The Same Velocity? We extract the following from the London Photographic News: At this season of violent thunderstorms, our readers will be interested to know of some observations which have recently been made respecting the phenomenon of thunder.

The Cereals of the United States, In an address recently delivered before the American Geographical and Statistical Society of New York, by Mr. John Jay, allusion was made to the progress of American Agriculture. His estimates were predicated mainly upon the last census of 1850, as compared with that of 1840, which, if strictly correct, afford a subject for the serious consideration of every farmer.

Breeding Sows and Their Young, Mr. J. H. Willard, who seems to understand the subject pretty thoroughly, gave sometime since, in the Maine Farmer, his views on the above subject, from which we select and condense the hints below:

The Year of Great Meteors, Four great meteors have been seen in the United States within less than a year. At half-past nine in the forenoon of the 15th of November, one passed over a portion of Connecticut, New York City and the southern part of New Jersey, in a S S W direction.

The Science of Bread-Making, When Science is applied to render society healthier and happier, by lessening the ills of life, she becomes the handmaid of Virtue. When she acts in that capacity I rejoice in her progress; but when she is forced by interested men to assume an attitude not in accordance with the true intent and design of the creation, it is the happy privilege of scientific journals and their correspondents to cut asunder the restraining band and leave fair Science free to resume her sacred mission.

When interested parties spread forth to the public the virtues of medicinal saleratus, dyspeptic saleratus, &c.—bread raised without yeast and nothing left in the bread but pure salt—heed them not! And if medical men can be found so far behind the times as to testify in favor of the use of alkaline matter in food, leave them to be benefited by their own prescriptions! Good yeast is the best agent at present known to raise bread with; and when the sponges is set, it should in a temperature of about 80 deg., and when it begins to work, it should be freely exposed to the air so as to allow the carbonic acid gas to escape with facility.
