cuts off the supply of blood to the part. Such an obstruction is often attributed to embolism-a small particle swept from the heart to some capillary and along and lodged in some artery; to a tumor pressing on an artery; to a flow of blood from a ruptured vessel already

affected with degeneration. Sometimes a feeble heart, unable to send the blood to all the capillaries of the brain, may give rise to it. It is often remotely due to prolonged intel-lectual efforts, strong and continued emotions, blows on the head, alcohol, or to disease of the heart, caused by acute rheumatism.

Softening of the brain may be either scute or chronic. The former is fatal within ten days. More commonly there are no premonitory symptoms, and the attack resembles that of paralysis. When premonitory symptoms occur there may be pricking sensations, cramps, blunted touch, diminished power of motion, increasing weakness of the affected side and clumsiness of the fingers, hands and feet, and a tottering

gait. Some of the symptoms of chronic softening are increasing feebleness, loss of memory, fretfulness, fits of uncon-trollable weeping, dull pains in the head, a sense of confusion, thickness of speech, gradual loss of muscular power, listleseness, and later, paralysis of one side, childishness, helplessness, disposi-tion to sleep most of the time.
