Farmers Report Corn Is Late in Maturing special short courses, which are open to anyone regardless of previous edu-

late in maturing as it is this year.

While most of the corn will mature with a late frost, yet if one does not have on hand or available a supply of old corn for seed purposes next year it should be worth while to select seed this fall. Tests have shown that the vitality of corn containing from 15 to 20 per cent of moisture will not be and corn with 10 to 14 per cent of moisture will stand the most severe winter temperatures without injury to its germinative power.

It is very important to dry the corn seed. This may be done by stringing the ears so that they do not touch, or by putting them on racks in a dry, being assured of good seed, field selection allows some choice of parent stalks, and of ear height. The smooth dimple dented ears are more apt to mature and germinate well than are the large, rough, deep kerneled ears.
