Plans to Re-Establish Farm Bureau, Abolished After War, Being Made in Platte County.

Columbus, Neb., March 2 .- Three different movements, all of which have as their slogan the improvement of farm methods, are under way in Plitte and the adjoining counties of central Nebraska.

Shortly after the close of the war period, older farmers among the foreign-born element succeeded in abolishing the farm bureaus here and in some of the other countles.

Now a number of the farmers, among them chiefly the younger ones native to Nebraska and a large part men with agricultural school training, are backing a move to re-establish the farm bureau.

Advocates of diversified farming are finding many followers, espec ially among the wealthier farmers through the increased demand for dairy cattle. Heavy shipments of these continue to be sent to Platte, Boone, Nance, Colfax, Butler, Polk, Merrick, Madison and Stanton counties. Agricultural schools and railroad lines are largely responsible for this activity, while produce and packing interests are increasing poultry raising and as a result incuba tors with egg capacities as high as

The third and newest phase of farm relief comes from the organization work of the National Producers'

Organizers are holding meetings at all of the small towns urging farmers to join a combine to control prices and not to sell farm products unless they can obtain cost plus a casonable profit.

# **Hogs Pick Food Under New Plan**

Iowa Expert Urges System of Allowing Swine to Be Judge of Own Needs.

Dixon, Ill., March 2.-Profitable hog production, based on the idea of giving the animals all they need in he way of feed constituents and letting them be the judge of their needs, was urged by Prof. John M. Evvar of the Iowa State college at Ames in an address here before the state farm ers' institute. Hogs need mineral feeds in addition to the best grain nixtures and pasturage, he said, in order to make cheapest and fastest gains and most profits.

In the course of long experimental work at Iowa State college, Professor Evvard has developed the soundness of the so-called "cafeteria" or Iowa practically revolutionized the pork ness. production practice of that state. Ex-

## Hen Sense

With a "bad egg" it's a case of out of the fryin' pan and into the carbage can, proving that hardboiled eggs should not be wholly condemned. They have their place.

But don't feed 'em to baby chicks, please. The hard-boiled egg idea is nonsense. It may not kill the chicks, but if it doesn't, they are getting plenty of green stuff and are a good, healthy brood to begin with. The poultry experts have turned their backs on the practice. The hard-boiled egg is an outcast in his own family.

The first two weeks are all important. The right start means a lot. Remember that these babies are your first investment. You're going to put more money into them as they go along, so make your investment a good one. Begin figuring now on dividends and build the chicks from the ground up. You'll not only realize quicker returns, but in the end-larger re-

turns, and you're going to cut out a lot of the losses.

The big trouble is overfeeding at the start. Most of us are too generous. A few pounds of the right kind of feed will give 100 chicks all they should have for the first 14 days-four or five pounds for each 100 chicks at the most—and 14 days just about finishes babyhood in the poultry family. Get them over that period and biggest risk is past. Feed them little and often is a good rule, so don't try to save money on a chick starting feed. You really need so little—the cost doesn't amount to anything. There are manufacturers that make a specialty of chick starting mashes. They know their business from scientific and practical experiments. Generally, complete feeding instructo do is to get a few pounds and

follow instructions on the package.

One thing to watch, of course, is is fibre content. The intestines of the baby chick are about the size of the lead in your pencil. Bulky stuff cannot be carried off easily Your feed must be highly concenstrated and finely ground, although not of a floury nature, which might have a tendency to clog. White diarrhea is dangerous and frequent, but not nearly so dangerous or so common as bowel impac-tion. When they begin to die right and left and you can't figure out why—the chances are it's a case of impaction. Watch your fibe content, don't let it run over 4 per cent. What a boy of 12 will thrive on, will kill a month-old baby. Don't fig-

ure to feed all your chickens out of the same bag. It can't be done suc-

THE start of the feeding period is more important than any other time in the whole L existence of the baby chick.

Tender, undeveloped digestive organs require easily assimilated, rich in bone, muscle and tissue-building proteins. Without such feed chicks are listless, stunted, prone to disease of every description, and even if they live will never develop into the strong, husky, mature fowl which are money-makers for the poultryman and a delight to the eye.

Red Feather Chick Starter will start your chicks right because it is first of all a Scientific Starting Ration which fills every natural feeding requirement of the baby chick. The first 14 days is the danger period. Carry the chicks safely through that period and you have won half the battle of raising chicks. For that reason we have designed RED FEATHER CHICK STARTER. Packed in a convenient self-feeder. this product will take the trouble and worry from your chick raising this season, eliminate bowel trouble and other digestive disorders and help you raise 90% of the chicks you hatch. Sign the coupon and send it in today.

Free booklet "S" furnished on request.
