How many can you identify?

(Your pharmacist uses them every day)

Pictured above is some of the equipment your pharmacist uses to compound the prescriptions your doctor writes.

- ①—**Pill tile.** Used for a variety of purposes, including the mixing of ointments and dividing of powders, as well as for rolling and shaping of pills.
- ②—**Prescription balance.** Used in weighing prescription ingredients, usually solids. So sensitive it can weigh one five-thousandth of an ounce.
- ③—**Filter paper and funnel.** Used to separate or filter out undissolved particles from liquids; eye drops, for example.
- ④—**Mortar and pestle.** Used for mixing and grinding operations to insure uniform and even distribution.
- ⑤—**Water bath.** Used like a double-boiler to heat mixtures, to melt ointment bases, or to maintain liquids at desired "below-boiling-point" temperatures, up to 100 degrees Centigrade (212 degrees Fahrenheit).
- ⑥—**Conical graduate.** Used to measure liquids accurately. Some of the smaller graduates measure quantities as little as a twentieth of a teaspoonful.

Ability to use specialized equipment with scientific skill reflects but a part of your pharmacist's training, gained in college laboratories and in actual practice. Qualified by law to engage in the practice of his profession, he has an intimate knowledge of thousands of different drugs — their dosage, usage, and properties.
