An extremely large area involving many states is seriously affected by drought. This means May 8. Cottage Homemakers that seed production acres will likely will be lower.

In addition, seed prices to ciety World Service meets at E. growers have been lower than usual this year which will discourage the "in and out" seed producer, Porter states. There probably will be an acreage reduction program involving the seeding of several million acres fellowship room at Methodist to grasses and legumes. This will require an abundance of seed. While supplies of alfalfa seed are plentiful, supplies of grasses are becoming somewhat

> How To Cool Eggs Egg producers desiring to cool eggs in a small space may find the answer by adapting the

Howard L. Wiegers, assistant professor of poultry at the University of Nebraska, says the cooler consists of a wind tunnel placed inside a refrigerated area. An electric fan is placed at one end of the tunnel and the air escapes through holes on the top. The holes correspond to the size of the bottom in egg gathering pails.

The eggs are gathered in wire mesh-bottomed milk pails and cooled by setting the pails over holes in the wind tunnel. As the cool air escapes from the tunnel it will flow around each egg cooling all of them in three hours or less. This permits casing quickly after laying and is a key to conserving egg quality.

The same cooling principle could be used for wire baskets if a funnel shaped form were devised in which to place the baskets. The funnel would serve as a trap directing the cool air from the tunnel through the baskets. Without the air being forced through the baskets, cooling will be quick only on the outer layer of eggs.

Plans for the Nebraska Egg Cooler may be obtained through county agents. The cooler is not adequate to comply with the current Nebraska egg law, but offers a method to convert the wind tunnel portion to cool eggs rapidly.

Effective Control Fortunately there are two insecticides that will give effective control against the aphid. Malathion may be applied at the rate of 8 to 10 ounces of actual chemical per acre or parathion at one-fourth pound per
