Case-o-Matic Premier Showing Set at Murray

Spotlights and limelights at the C&N Improvement, Murray, premier showing of the Case-o-Matic tractor line March 10.

Bob McKeary explained that "We are holding a special Open House during which the people in this area will get the first look at the new Case-o-Matic tractors with year-around styling, engineering and performance." In the "lineup" will be typical representatives from the new Case-o-Matic line of 12 tractors and 12 models. This impressive lineup includes crawler models and other models completely new from both headlight to hitch, far on-the-horn and off-the-horn jobs.

Spotlighted during the Open House was what McKeary regards as "the greatest engineering achievement in farm tractors in 15 years." This is Case-o-Matic Drive.

A motion picture specially filmed at the "World Premier" in Phoenix, Ariz., will be shown every hour on the hour. This film features the new Case-o-Matic Drive and other models. Case-o-Matic Drive is described as being entirely different from conventional tractor power. McKeary said that the Case-o-Matic Drive doubles the power instantly, positively and automatically. He went on to say "With Case-o-Matic Drive there's no stalling, no shifting, no stalling."

Open House dates are scheduled for March 10 at C&N Improvement, Murray, from 1 p. m. to 8 p. m. There will be refreshments for those attending. —Adv

Weather Key To Hopper Population

Barring adverse (or the hopper) weather conditions this spring, we can expect grasshopper numbers similar to those in 1937, a U. S. Department of Agriculture entomologist declared.

Jerry Bell, who is stationed at the College of Agriculture in Lincoln, made the statement at the annual Aerial Application Short Course.

His own surveys conducted last summer and fall indicate a very high percentage of grasshoppers hatched and deposited eggs in the soil. Weather conditions last fall gave the grasshoppers ample time to deposit the maximum number of eggs in the soil.

The main grasshopper problem in 1938 are expected to be in central and eastern Nebraska. However, if weather conditions are favorable—warm and dry—grasshoppers may move about Nebraska from British Columbia and eastern Wyoming, indicating heavy grasshopper infestations which could move into western areas of Nebraska during the growing season.

The main grasshopper problem in 1938 are expected to be in central and eastern Nebraska. However, if weather conditions are favorable—warm and dry—grasshoppers may move about Nebraska from British Columbia and eastern Wyoming, indicating heavy grasshopper infestations which could move into western areas of Nebraska during the growing season.

As the best of populations in Nebraska last year there were approximately six million acres of crop land infested with grasshoppers spreading eight or more per acre in the field, Bell said.

Populations in field infestations were 20 or more per yard and ready to move into the fields. In the more areas of the state an estimated 100,000 acres were infested with grasshopper populations of eight or more per yard.
