'Class 2 and 4' Land Use in State Discussed

Productivity is higher on class 2 land than on class 4 land, granted that moisture, organic matter and fertilizer are equal, and no hardpan exists.

Harold Gilman, Extension conservationist at the University of Nebraska college of agriculture, also noted that class 4 land is not suitable for continuous cultivation because of its susceptibility to erosion.

Steep slopes and degrees of erosion are the usual factors making it necessary to classify tracts as class 4 land, he reported.

"Intensive conservation practices have to be installed which include seeding this type of land to grass approximately 50 per

cent of the time," Gilman advised.

"The additional cost of seeding and obtaining a grass stand in a shorter rotation usually does not make this type of land as profitable as class 2 land. However, class 4 land under proper management can be made to pay," he concluded.

The definition of class 2 land is "good land that has some natural limitations. It can be cultivated safely with easily applied conservation practices such as terraces, contouring, cover crops, waterways and drainage."

Keep'em Young

The term "piston ring" is familiar to practically anyone who owns or drives a car. It's a steel ring which helps to increase an engine's efficiency by sealing in the power from the burning gas. If the rings become clogged with carbon and gum, they don't seal in the power the way they should, and your car gets sluggish—starts burning oil.

Modern motor oils are designed to keep these vital piston rings free from harmful deposits.

its, and that's one reason why engines last so much longer than they used to.

You can help keep your car's engine "young" by taking the advice of these automotive experts—change the oil with your next lube job.
