| Rock Gardens. <br> A rockery is attractive if well made and not out of place. It should be made only in locations where a natural heap of rocks covered with flowers and vines would not seem unexpected or out of tune with surroundings. A sunken rockery is the most attractive, but the hillock shape is less costly. If convenien, build on a shady southeast slope. Dig below frost line and use the earth removed as side filling. The stone work should be finished and firmly wedged before filling with earth and gravel. Good plants. mosses, vines and ferns can be found about any forest ledge, and the nurserymen sell rock plants and alpine change. <br> Futter or Goose Fat. <br> 'The most popular substitute for but- <br> ter in Germany is said to be goose fer. eWight for weight, butter costs less than the fat, but then the latter spems to be far more economical. A pound of excellent butter can be had in Ferlfn for about 30 cents. Goose fat, on the other hand, is sold by the litre ( 1.76 pint) at an average price of 70 to 75 cents. In a recent government publication there appeared a suggestion from the American consul at Berlin to the effect that Germany offers a good market for this article of food. <br> Low Wages. <br> An English farmer writes that he knows several farmers who have lately surrendered their rented farms solely from the difficulty of getting labor- | Farm Notes. <br> The fodder shredder is doing gooc work in one respect, and that is in reducing the number of shocks of corn that stands in the fields all winter. At the shredder husks the corn, and shreds it at the same time, farmers find that it is more comfortable to haul the fodder to the barn than to stand out in the fields and husk the corn and then waste the fodder. <br> There is one crop that must be at, tended to now or it will soon be tog late-asparagus. It comes earl- in the year, almost as soon as the frost leare: the ground. The bed will be benefited; if shoots have not apepared, by receiving a covering of straw, salt hay oi any refuse material and burnt over, sa as to destroy disease germs that magy be left over on the surface of the ground from last year. <br> Growing a lot of pumpkins in a field of corn is an old practice, but it is doubtful if pumpkins so grown are as profitable as when grown as a separats crop from corn. The pumpkins will prevent the proper cultivation of corn, as working the corn destroys the pumpkin vines, the result being that late weeds get a chance to grow and mature. It is urged in defense of growing pumpkins in the corn field that they do not interfere with cultivation until the corn is "laid by," but mach depends on the land, rainfall and thoroughness of cultivation. Corn should never be "laid by" as long as weeds and grass can have an opportunity to grow, cultivation being given if it is possible for a horse to pass along the rows. |
