

New Parole Regulations.

New regulations for prisoners pa roled from the state penitentiary have been adopted by the state prison board. Under the new provisions convicts must report the number of and they have been employed during the month, the number of days lost, reason therefor, amounts carned during the month and how spent and the total amount of money saved and where it is being placed. Paroled convicts must also make a report as to the number and character of magazines they have read, as well as the daily newspapers they have been interested in or have taken during the month. It is also made incumbent upon the paroled convict to write his opinion for the board on the magazine articles, and particularly to set out his own individual impressions thereof. Further, a religious record is kept and the prisoner must report his church attendance and must certify that he has not visited any saloon, mbling hall or place of ill-repute each month during the parole.

Investigating Constitution of 1875.

J. H. Broady of the state codification commission is now investigating the numbering of the articles in the state constitution of 1875. The different statute makers have numbered the articles differently beginning with article 14. Thus the supreme court in referring to articles of the constitution semetimes cites a section that is found to contain different subject matter in different compilations of the constitution. An examination of the original constitution in the office of the secretary of state shows that the secretary of the constitutional convention ceased numbering after article No. 2. After that the word "article" appears without a number and the first published copies of the constitu tion contained an error in the numbers after article 14. Later this was corrected, so that two different systems of numbering are used.

Not Up to Specifications.

The state, in buying canned fruit for its institutions, specifies "20 per cent syrup," which insures a good quality of fruit if the contract is complied with. One institution received some goods for the present quarter that were quite destitute of sugar. The matron complained to the grocer, who insisted that the fruit contained the required amount of sweetness. She then took samples to the state food commissioner, who reported that the peaches contained less than 5 per cent of syrup and the pears contained none. The state has refused to receive the fruit because it does not come up to the specifications in the bid,

State Labor Commissioner Guye has received a letter from V. S. Loubkov, a Russian Jew who is an officer of the New Israelite Evangelical association, and who is now in San Francisco. The writer asks in regard to land in Nebraska for a colony of 2,000 Jewish families. Mr. Guye is now at work trying to obtain land for Jews of Chicago who desire to colonize in some western state.

Mrs. Alice Ramsey, mother of Convict Charley Morley, soon to be tried for the murder of Warden Delahunty, is in Lincoln after traveling from her home in Knoxville, Mo., to be present at the trial of her son. Disk Harrow May Be Used as Substitute for Packer.

Essential That Sufficient and Proper Cultivation Be Given to Destroy Weeds-More Important Than Soil Mulch.

By PROF. A. M. TEN EYCK, Superintendent Fort Hays Experiment Sta-

When land is allowed to lie for a considerable period after plowing before the crop is planted, the settling of the soil, with the surface cultivation to preserve the mulch and the cementing due to rain, usually causes the soil to repack and firm up to a sufficient extent to make a good seed

The use of the packer is most essential on late spring plowing, when the purpose is to plant at once after plowing. It is not necessary to use the subsurface packer on fall plowing which is not intended to be planted until the following spring, but for sowing fall wheat, if the plowing precedes the sowing by a very short interval, the subsurface packer may used very advantageously.

The principle involved in the use of the subsurface packer is correct, and the lighter the soil and the greater its tendency to remain loose the more necessary becomes the use of the subsurface packer or similar implement, in order to prepare a proper seed bed.

In plowing under trash or manure, subsurfacing packing, by pulverizing the bottom of the furrow-slice, sifts the soil through the coarse trash and causes a better union with the subsoil below, so that the capillary water

Prof. A. M. Ten Eyck.

may be drawn up into the surface soil whereas, if a heavy coat of stubble or manure plowed under in this way is left without packing or pulverizing, the furrow-slice is apt to dry out and the crop that is planted on the land may be injured by a short interval of dry weather.

By setting the disks rather straight and weighting the harrow, a disk harrow may be used as a substitute for the subsurface packer, resulting in a pulverizing and firming effect at the bottom of the furrow-slice, may largely accomplish the results required in preparing a proper seed bed. It is usder to cause it to stir and pulverize light harrowing.

Governor Aldrich has appointed Cap | early plowing, to destroy weeds, in my | row was not to be compared with the experience has usually been sufficient | harrowed grain, either in appearance, to settle and pulverize the seed bed. size of plants or heads of grain. This is more important than tivated with the weeder or harrow in order to break the surface crust and The united effort to raise the half prevent the loss of moisture, and folrowing or work with the weeder is continued after the grain or corn is up, and during the growing period, frequent cultivation is required for in-

tertilled crops. Again, after the crop is harvested, Major Julius A. Penn, Twelfth the cultivation is continued; the land of the Nebraska national guard is prevent the loss of water already stored in the soil, but also this same | yield from year to year.

HELP IN DRY FARMING condition and mellow surface favors the absorption o rain and largely prevents the loss of water by surface drainage.

The ideal soil mulch is produced by loosening the surface soil as soon as it is dry enough to cultivate after the rain. The mulch should be mellow and granular, not pulverent and dusty. Avoid producing a "dust" mulch which results from harrowing very dry soil; such soil is likely to blow. Also, the smooth, finely pulverized surface left by continuous light harrowing really defeats the purpose of the cultivation, since soil in such condition will shed heavy rains, causing a waste of water which should have been stored in the soil, and the surface often becomes too fine and compact, preventing the propc: aeration of the soil, and producing an unfavorable seed bed condition. Thus during the interval between crops, it is often advisable to use the Acme harrow or the disk, or springtooth harrow, in order to keep the surface of the soil open and mellow. Disking and Listing Versus Plowing.

A new method for preparing the seed bed is now coming into general practice ir western Kansas. In preparing land for wheat, the plan is to list the ground with the ordinary corn lister as soon after harvest as possible. The lister furrows are run about three to three and a half feet apart, very much the same as when the lister is used for planting corn. Later, when the weeds have started, the soil is worked back into the lister furrows by means of a harrow or disk cultivator.

Several cultivations are usually required by the harrow and disk harrow in order to level the field and bring it into good seed bed condition. Once over with the disk cultivator is sufficient, the further work necessary to prepare the seed bed being given with the common harrow.

CONSERVE MOISTURE IN SOIL

Ground Which Is Kept Loose on Top Will Evaporate Less Water Than Land That Is Packed.

By E. B. HOUSE, Colorado Agricultural

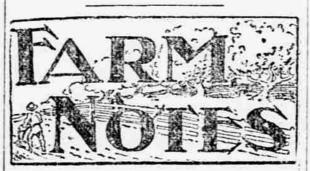

It is a well-known fact that ground which is kept loose on top will evapcrate much less water than a soil | broiler crop as early as possible. Dewhich is packed on top. The mois- lay means loss. ture which escapes into the air is absolutely lost, so far as the plants growing in that particular field are concerned, and if anything can be done to hold this moisture in the ground so that it may reach the roots the thing to strive for, and will prove | from any other one cause. a benefit to the plant growing in the

sentatives from the Agricultural college was visiting an up-to-date farmer in the country, and the farmer showed him a field of wheat which illustrated this harrowing in a remarkable man-

A storm had passed over that section of the country and about 11/2 inches of rain had fallen. It had been, to make the growth they should. a dashing shower and had packed the surface of the ground considerably. The grain was from 4 to 6 inches high, and the farmer had been advised to harrow the field to prevent evaporation. He sent his hired man to do the work, who hitched on to the harrow and dragged it diagonally across the field of wheat and then around the outside of the field some 5 or 6 times. He then became disgusted with the work because it appeared that he was dragging out so much grain, and reported the fact to the farmer, who ordered the work discon-
