If the object be to in-leaving one good stalk to grow up, sa

years in succession. Potatoes and a few other things may form an exception to this general rule, but it is wise to keep up the rotation. Progressive gardeners now grow everything in drills or straight lines, not ex cepting corn and potatoes. Not only are larger crops from a given surface grown in this way but cultivation becomes easier. Remember in the preparation of soil for vegetables that thorough preparation previous to dropping the seed greatly lessens the after culture of the crop. This is especially true of corn. Great care ought always to be observed in the selection of seeds, and it is best to take for the main crops the varieties that have been tested in the vicinity and found trustworthy. This, however, need not prevent the trial of new varieties in a

matter. At a rule, do not let the same

crops occupy the same bed or spot two

noderate way. No safe rule can be established as to the depth at which different eeds should be sown, as the weather and varieties of soil must be considered. If continued damp weather could be assured the rule observed by some of covering the seed to a depth equal to its own thick ness would be a safe one. At whatever depth the seeds are sown the soil ought to be brought into contact with it by firming with a board or back of a spade. If you do not grow asparagus for market, at least raise enough for your own table. It is a healthful luxury within the

plot of land. In planting for private use set out in beds five feet wide, three rows in a bed, the outer being each one foot from the edge, and allow twelve inches in the rows; set the plants at least six inches below the surface. For market gardening on a large scale set four feet apart one way and one and a half the other, which will allow the use of a horse and cultivator to keep the weeds under. Every fall a good dressing of coarse manure should be applied after the tops have been cut, and in the spring forked in. The roots need the benefit of some foliage during

To Keep Plants in Winter. A new principle for keeping plants

shoots should attain before being pinched depends upon the nature or mode of growth and bearing of the species. wanting in the kitchen and garden, though

In a general way it may be advised to it is one of the market gardener's remuner pinch early the soft extremities of the ative crops. In private gardens it is shoots on the vigorous parts, and as late cheaper to buy the plants. Let the celery as possible on the feeble parts, excepting follow some early crop. It setting out always any shoots which may be too celery plants be careful and firm the earth vigorous for their position. well about the roots Indeed, in the

Remember that the leaves serve to prepare the sap absorbed by the roots for the ourishment of the tree and aid the formation of buds on the shoots All trees. therefore, deprived of their leaves are lia ble to perish. This principle shows how langerous it is to remove a large quantity of leaves from trees under the pretext of aiding the ripening of the fruit. Thinning out fruit while it is small

another important work where fine, well developed specimens are desirable. In performing this thinning out be sure and leave a large amount of fruit on the strong part of tree or vine, and remove the whole or greater part from the feeble.

Brief Definition of Silos and Ensilage. Ensilage is forage that was cut when green and has been preserved in a silo for leeding to stock. Silo is properly a pit with air tight sides and bottom, but the name is also used to designate a receptacle for ensilage constructed wholly above ground The pit is commonly walled up with stone or brick, with bottoms and sides so comented as to be air and water tight, and where the ground is solid enough to admit of it the cementing may be done the variety. on the earthen sides.as is often practiced in building cisterns for holding water. Silos above ground may be made of heavy masonry or concrete walls, but more com monly of wood. In the last case the silo is really a large wooden box with ends and and the depression of the rows turns into sides made air tight by smooth boards nailed together double, and inclosing a lining of tarred roofing paper between largely wasted. them

First, sills are laid on smooth dry ground for a foundation, next a frame of 8 by 6 studding is set up, strengthened It has been decided that the \$15,000 ap with girts and braces and well bound to gether so as to withstand the pressure from within. The double boards with versity the tarred paper form the lining of the silo inside of the studding, and the out side is weather boarded in the usual way. leaving an air chamber between it and the roofed over to protect it from rain, unless constructed inside of a building, the whole or a part of which can be used for that purpose, and the bottom must be ce

Sweet Corn.

It is better to plant sweet corn in rows than in hills, and if the plants are thinned out to about eight inches apart in the rows, with the rows four and a half feet apart, the yield will be larger than that gained from hills. Large areas of field corn are nowadays usually planted in drills and corn planters and cultivators are generally adopted. Flat shallow cul ture is gaining new advocates every sea son, especially in the eastern and middle states in the northern and western states the system of "checking" corn is still practiced to some extent.

By successive plantings, made every two weeks, the season of sweet corn can be indefinitely prolonged. Numbered with early varieties that have gained about a foot apart each way in the bed D. EVANS, M. D., and then cutting out all the small "grass." Celery is another luxury that is often
