Tired, Worn Out

Hood's Sarsaparilla makes the weak strong. "My husband has received great benefit from Hood's Sarsaparilla. He was afflicted with stomach and bowel trouble and at times was confined to his bed. After taking two bottles of Hood's Sarsaparilla, he was better. He now feels like a new man."

Formerly upon rising in the morning he would feel tired and worn out. Last winter our children had the grip and we gave them Hood's Sarsaparilla.

A Curious Story

There is a man of an Iowa Captain who, in a distant corner of the southern sea, visited an undiscovered or unexplored group of beautiful islands. After landing and trading with the gentle natives, he was astonished to find a white man, evidently a person of means and consequence, who, after making himself very agreeable, implored the Captain to give him a story-book. If he had such a thing in his possession, the Captain had, and, deeply touched by the pips and cocoanuts which the white exile had given him, bestowed on him a copy of "Arabian Nights Entertainments." Overcome by the present, the exile burst into tears, and cried, "You have saved my life, and given me rank and wealth, and I have been content, but I should long ago have been content, but while they were fattening me, I learned enough of their language to tell a child the story of 'Little Red Riding Hood.' The child was a boy, and the whole population were mad with joy. They had never heard a story before. From that day I became a great and honored man. When they had a national festival they called me 'Little Red Riding Hood' and wept (while some elderly relative was being cooked for a feast) at the cruel death of the grandmother as caused by the wicked wolf. I had with me a volume of 'Fairy Tales,' and I soon began to set a price on my performances. 'Red Riding Hood' is rather new; I only get a hundred cocoanuts for her now; but 'Little Red Riding Hood' is a pig and a turtle, and 'Beauty and the Beast' brings six or seven, according to the quality. But with the 'Arabian Nights' I shall be able to go on accumulating pork to the end of my days."

To Make Canvas Waterproof

Prepare three baths, as follows: The first, by dissolving one part of neutral sulphate of alumina (concentrated alumina) in ten parts of water. For the second, boil one part of light resin, one part of soda crystals, and ten parts of water, until the soda is dissolved; add one-third part of common salt, to settle the water, and collect the soap. Dissolve this soap with an equal amount of good palm-oil soap in thirty parts of water. This soap bath must be used hot. The third bath consists of water only. Soak the canvas thoroughly in the first or alum bath; next pass it through the soap bath; and, lastly, rinse in the water.

Toasting on the "Briar"

Is very far from amusing, untraveled reader. It is a very far from amusing, untraveled reader. It is a very far from amusing, untraveled reader.

Her "Cousin"

A telegram came to the Wesleyan Female Seminary at Cincinnati for Miss Mary Joseph, daughter of a State Senator, saying that her father had died suddenly of apoplexy. The school officials gave a ready assent to her speedy departure, and did all they could to soothe and assist the seemingly grief-stricken girl. She was joined at the depot by a young man, whom she introduced as her cousin. He really was her sweetheart, and had sent the message according to a previous understanding with her father because her father was dead, for he was not, but to enable her to get out of the seminary and elope with him. They were married before the fraud was discovered.

Abrella (or Dot) Toss in a Chair

Clutching convulsively at her skirts, she cried, "Abrella! A man is coming! Come and catch it, quick!" Bridget, "Shure, mum, there's no hurry. If this one gets away, I can catch plenty more for yer, mum."

Knowledge

Brings comfort and improvement and tends to personal enjoyment when rightly used. The many who live better than others and enjoy life more, by less expenditure, by more promptly adapting the world's best products to the needs of physical being, will also find the value of the pure liquid laxative principles embraced in the laxative, Syrup of Figs.

Agriculture

Hollow Hearted Potatoes

"What causes hollow heart in potatoes?" This query was recently answered by a number of agricultural authorities in the columns of the Rural New Yorker. A large percentage of their correspondents admitted that they did not know, but each expressed opinions, both regarding the cause and the prevention. Prof. I. H. Bailey said that he had always supposed hollow heart to be due mostly to overgrowth, although some varieties are more subject to it than others. He thought that firm fleshed varieties of medium size, grown on soil only moderately rich in nitrogen, would be most free from the trouble. Dr. W. C. Sturgis of Connecticut stated named as the cause of hollow heart Pythophora infestans, a potato rot fungus. He said nothing but absolutely sound seed should ever be used. It is not a peculiar characteristic of certain varieties, though, as a rule, early varieties are less liable to attack. Dr. Sturgis doubted the accepted theory that there is greater frequency of hollow heart in large than in small potatoes. Dr. Hyron D. Halsted did not know the cause nor the reason why large potatoes are often hollow hearted than small ones. He thought probably large tubers were oftenest affected because the excess in size permits all this absence of tissue at the center, not together for the same reason that a large tree is often hollow, while a small one of the same kind has a sound center. As to a half way answer in the matter he suggested that the central portion of a potato is the most nonliving portion, and that the storehouse for starch to be used by the young buds when they unfold, these buds and the vital parts associated with them lying somewhat midway between the surface of the potato and its center. In the development of a potato we can see that there might be a cavity developed in the center by the failure of the sufficient development of storage tissue to occupy all the space. As to the breeding out, it would seem probable that it could be done to some extent. Because anything like hollow heart is likely to be somewhat of a matter of inheritance—call it a weakness if you please—and therefore one should use strong instead of weak seed. Prof. W. F. Massey hazarded the opinion that hollow heart is due to an excess of nitrogenous food in a moist soil. There may be some fungus growth connected with it, but he can not think there is any fungous cause for it. The potato tuber is the plant's reservoir for the storing of starch for the food of the plant another season. If the excess of nitrogen stimulates the vital principle of the plant to an activity in cell formation in advance of the supply of mineral food needed for building materials, there is sure to be a gap somewhere, and usually where there is greatest activity. He does not believe there is any heredity about it. With an abundant supply of potash he thinks there would be little of it. With plenty of nitrogen and a deficiency of potash there will be hollow hearts usually.

Milling Qualities of Wheat

It has been known for several years that wheat of the best quality, by the miller was a variety which was hard and flinty, because in milling it produced a flour of superior quality, one that was especially liked by the bakers and consumers, says a Nebraska bulletin. The farmer desired a flour that would produce a greater number of loaves of bread of good quality. This depended in a great measure upon the per cent of gluten (an albuminoid compound) in the wheat and flour. The soft wheats contain a large per cent of proportion of starch to albumen. It therefore often happens that the variety of wheat which is most profitable for the baker and the miller to handle is the very one that is in poor variety for the farmer to raise, for the reason that it is not a strong grower and does not stand up well in the field to raise wheat that is of a large berry, that grows strongly and branches or tillers well, and that threshes out the greatest number of bushels per acre. This to him is manifestly to his great profit, provided the price of wheat remains the same, but the miller can ill afford to buy much wheat of that character, as it must be mixed with wheat of harder berry in order to produce a nice even quality of first-class flour. Gibson, in his work on milling says, "The facilities for knowing flours are better in the flour markets than in the mills." "The facilities for examination are best where there is the greatest variety of flours." Color and strength are the two essential points in flour. If very white, but of poor strength, or if of dark color and good strength, flour are equally undesirable from the baker's standpoint, and so do not sell well. The strength depends upon the amount of gluten present, while the color depends on the amount of foreign substance in the flour, i. e., fibrous matter from bran, middlings, etc., together with material from the germ of the wheat. This last makes dark flour. Again, the fineness of division affects the color. The finer ground flour, other things being equal, has the lighter color.

Gluten Meal and Oil Meal

The value of glucose meal, or gluten meal, or gluten feeds, as it is variously called, for milk production, has been the subject of quite extensive experiments at the Vermont experiment station. Seventeen trials of single cows were made, in which these different feeds were compared with bran and corn. In the majority of cases they were found to produce more milk, or richer milk, or both, than either corn meal or a mixture of corn meal and bran, so that in almost every trial more butter was produced by means of the underfeed than by means of the gluten feed. This is the undoubted fact of the feeding of protein contained in these feeds. They serve to supplement the deficiencies of corn meal, hay, corn fodder, etc. In this particular, and to make up what is known as a balanced ration. The cream gluten meal mentioned above is very concentrated feed, and both it and the corn germ meal are especially rich in fats and should be used with caution. Probably two pounds

Hydrophobia in a Horse

Recently a case of hydrophobia in a two-year-old colt was developed on the farm of Eric Anderson near Nordness. The tenant on the farm went out in the morning and found the colt in the pig pens chasing the pigs around. In attempting to drive the colt out the man was bitten on the arm, and luckily the teeth did not penetrate the skin, only tore it loose, and it is expected no bad results will follow. The animal ran all over the place, chasing other stock, biting itself, and trying to bite the others, and acting in other ways as a mad dog. It was allowed to continue until exhausted in order to get it in all stages of its madness, and finally fell and died with every symptom of a genuine case of hydrophobia. The above facts are supplied by Dr.

Whitcomb, who went to Nordness to examine the case.—Decorah Republican

Washing Blankets

A sunny, windy day should be selected, and only one pair washed in one day. First put the blankets on the line and shake the dust out of them. Cut one pound of good soap in small pieces and boil in two quarts of water till dissolved. Add half a pound of powdered borax. Fill a tub about half full of water and add the soap and borax. Be sure to have the temperature of the water the same as that of the outside air. This is not a difficult matter, as town water is usually a little colder than the air in spring and summer, and only then should blankets be washed. Press the blankets down into the water and avoid rubbing; then let the soap and borax do the work—they certainly will. Soak for one or two hours, then raise them thoroughly in several waters until the rinsing water looks clear, taking care to have the rinsing water the same temperature as the first water and the outside air. Then without wringing, put the blankets on the line. Do not wring them, and be careful to hang them straight even, then the color in the stripes will not run into the white. Although dripping wet, on a clear day they will dry in four or five hours and will be soft and clear. The wringing and washing, will show to a certain extent, although they will look more like new ones than they did before washing. Take in when perfectly dry. They should not be ironed or pressed. They will be clean and will smell sweet. With wet tubs the only hard work is to get the blankets on the line properly, and if some one will "lend a hand," even this is not very laborious.

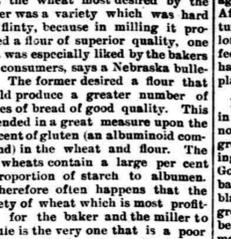

Western Corn Root-Worm

—Is the larva of a small green beetle, a near relative of the striped squash and cucumber vine beetle. The eggs are laid about the roots of the corn in late summer and hatch the following spring or early spring. If corn follows corn on the same ground year after year these worms will continue to increase and feed on the roots of the corn plants. The effect of these worms on the roots is to destroy them and thus wholly or in part destroy the crop. A rotation of crops from corn to any of the small grains or grasses is a perfect protection.

THE LIMA BEAN

—The Lima bean has been so called for a hundred years, as it is the first name indicated, and has first been known in all South America. The common kidney bean seems to have first been known to the ancient Peruvians.

Group of Kentish or Romney Marsh Sheep

GROUP OF KENTISH OR ROMNEY MARSH SHEEP.—From Farmers' Review.

Growing Onions

The so-called new method with onions is little more than an extension of their growing season by starting the plants early in the spring under glass, writes W. E. Farmer in American Cultivator. But this innovation is sufficient to stamp the work as new, and really worth all of the talk about it. By adopting this method we are pretty sure to make the crop a success. Had seasons, late seasons and other unvariable conditions can not do much harm to the crop, or, at the most, the injury from these causes is reduced to the lowest minimum. Where the soil is suitable, the large white onions are the most profitable to grow, for the demand for them is always in excess of red and yellow, and the prices paid are sometimes nearly double. In the eastern states the white onions reach their perfection, and they sell for from \$1 to \$2 per barrel more than the red and yellow ones from other sections. This is due to the peculiarity of the soil and the coast climate, and farmers have developed the industry in that section by persistent study of the needs of onions. But the red and yellow onions prove profitable enough in any section where the land is suitable for their culture, and far more so if the so-called new method is adopted. The seed should be sown in the hotbeds six or eight weeks before the time for ordinary planting in the fields, and as the best conditions possible can generally be given to a hotbed these seeds should be given a fine start in life. They should not only be started early, but they should be kept in constant growth until ready for transplanting. If the season is late they should be kept in the hotbeds until it has grown warmer and dry. There is no particular need of hastening the time for transplanting, as the onions are growing all of the time, and nothing is thus lost. The field should be prepared thoroughly for the onions, a well-drained, sandy loam soil being the best for the work, especially if it is full of decaying vegetable matter. Fertilize and pulverize thoroughly. Young ground is not so good for onions. They need a soft pulverized mellow soil, so that the dirt and fertilizers can surround the bulbs and give them nourishment. The onions should be transplanted into rows one foot apart and three inches apart in the rows. Set the plants firmly in the soil, and exterminate all weeds that have attempted to start, and there will be labor saved. Careless transplanting generally has to be gone over again several times, making the work more than double. A hotbed of three to six feet large should produce enough onions for eight or nine square yards of ground, requiring about one and a half ounces of seed.

Cow's Cough Balsam

It is a powerful blood purifier and makes the weak strong. It is a powerful blood purifier and makes the weak strong.

Language of the Month

Some wisemen propose to read woman's character by her mouth. Here are the rules to be observed: If her mouth is very small there is not much mind, but overmuch shallow sentiment. If she has a very large mouth she will possess a good brain, but the trouble is in kissing it. Large mouths put a man to an artistic test; he will be driven to his wit's end whether to begin with one corner of the mouth, or the other, or to make a heroic dash at the middle and endeavor to reach both corners. But if you are a kissing artist it can be covered nicely enough. If you are not a kissing artist, a woman formed mouth she will be sensual and full of strong, coarse points of character, and will raise a row in the family. If she has a delicately formed mouth, she will have much sensibility and perfection of character, but will not astonish by her brilliancy of conception or execution. It is a good mouth which is kissable and submissive. Shun blue-lipped or thin-lipped women; they will bore you to death with literature or woman's rights, theorize while you want your dinner, or spill your temper by their red-hot scolding tongues.

A Queer Custom

Among the Russians the father and mother of an infant are not only cannot be present at its baptism. The godfather and godmother, by swearing for the child, become related to it and to each other, and a lady and gentleman who have stood as sponsors to the same child are not allowed to marry each other.

Hanson's Magic Corn Salve

It is a powerful blood purifier and makes the weak strong. It is a powerful blood purifier and makes the weak strong.

A Hard Lesson

One of the hardest lessons to learn in life is that the man who differs with you, not only in opinions, but in principles, may be as honest and sincere as yourself.

Western American Scenery

The Chicago, Milwaukee & St. Paul Ry. has been ready for distribution a large portfolio of scenic views of the line. Half of the size of the World's Fair portfolio, and can be obtained without delay by sending the amount to GEO. H. HERRING, General Pass Agent, Chicago, Ill.

What is man's own the most unkindly part of his body? Because it is constantly getting into scrapes.

"Put no fulsome compliments on my tombstone," said a wife. "Don't give me any epitaph."

THE LIMA BEAN

—The Lima bean has been so called for a hundred years, as it is the first name indicated, and has first been known in all South America. The common kidney bean seems to have first been known to the ancient Peruvians.

Saturday Night in a Kansas Cattle

The dullness which had so weighed upon us through the long, uneventful afternoon was but a lull, we soon learned, and not a stagnation. With the first approach of darkness, the halcyon rabble of its eyes, so to speak, and leaped to its feet—and in a twinkling, it seemed like an incantation, Eastman said, Grand avenue was a carnival of light, and motion, and music. The board sidewalks were crowded with promenaders, smiling groups passed in and out of the drinking saloons and gambling places; in every quarter glasses clinked and dice rattled (and in these another sound in the world like that of shako dice); violins, flutes and cornets set out eager, inviting strains of waltz and polka from a score or more establishments, and a brass band was playing patriotic airs in front of the theater. The second part will contain stones, a variety of mineralogical value, and will be placed in the museum of the Ecole des Mines. The third part, composed of 132 carats, worth 100,000 francs. By selling the jewels of the third class, M. Turquet expects to realize the sum of 3,000,000 francs, and with it he will purchase works of art and enrich the national museum.—Parisian.

Hardly Prepared

"Are you prepared for death?" the clergyman asked, with a tremor of emotion in his voice, as he took the sick woman's hand in his own. A shiver of terror though crossed the invalid's face, and by-and-by she said she didn't hardly believe she was; there was the little bedroom carpet to be taken up yet, and the parrot had had hardly been touched, and she did not want to put up new curtains in the dining room, but she thought if she didn't die until next Monday she would be about as near ready as a woman with a big family and no girl ever expected to be. P. S.—That woman got well.

Abundant Hair

Japanese women are very proud of their hair, which is black and lustrous. They cultivate and arrange it with great care by brushing their tresses back from the forehead and gathering them in a plaited topknot, covered with flowers. A shaven head is a mark of dishonor, and is looked upon with angry looks. At length, as we looked and listened, the sharp, significant report of a pistol, with a shriek behind it, was borne toward us from a curtain-dancing hall to certify its sale of combat and probable homicide, and to be succeeded by a close but brief halt in the noisy quadrille—presumably for the removal of the victim.—Henry King, in Scribner.

E. A. ROOD, Toledo, Ohio, says: "Hall's Catarrh Cure cured my wife of catarrh fifteen years ago. It is a powerful blood purifier and makes the weak strong. It is a powerful blood purifier and makes the weak strong."
