Immense Loss of Butter. An Iowa bulletin says: In studying the question of how to make the dairy most profitable, two problems are presented for solution. The first of these problems is, how to produce the greatest amount of butter fat at the least cost; the second, how to save all the fat produced and market it in the form of high-priced product. Both of these problems are being studied, not only on thousands of dairy farms, but at many experiment stations. During the past nine months we have been devoting special attention to a study of the loss of fat in the butter milk in churning, with the hope of ascertaining the causes of the loss, whether it can be avoided, and if so the conditions necessary to secure the best results. This report gives the results of the work we have done so far in this line. If the value of the butter fat annually lost in the butter milk in the creameries and dairies of the state of Iowa alone could be accurately ascertained the figures would reach such astounding proportions as to be almost incredible to those who have not investigated the matter. During the past summer we have tested a great many samples of butter milk from creameries and private dairies. In only one sample did we find the amount of fat as low as two-tenths of 1 per cent, while in a number of cases we found the fat in the butter milk to be above 1 per cent, and one sample tested as high as 7.20 per cent. The loss on the farm and in private dairies is much higher than in the creameries, but we have found as high as 2 1/2 per cent of fat in butter milk from creameries; but this we believe to be exceptional. It is quite common, however, to find as much as one-half of 1 per cent of fat in the butter milk from creameries; and if the amount of fat lost was carefully determined by daily tests it would be...

found that the creamery that is not suffering a loss of several dollars a day from this cause alone is the exception, while in some creameries, where large quantities of cream are handled, the value of the fat lost in the butter milk would pay for several extra men and then leave a very comfortable profit. We have before us the report of one day's work in a creamery in this state. The amount of milk received was 10,192 pounds. In running this milk through the separator a total of 4.3 pounds of fat were lost in the skim milk, but in churning the cream the next day twenty-nine pounds of fat were lost in the butter milk. Considering this fat worth 20 cents per pound, which it was about its value at that time, the loss in the butter milk for one day would be \$5.80. Some creameries receive many times the amount of milk or cream mentioned above, and in them the loss, at the same rate, would reach figures that would render the owners most decidedly uncomfortable. From the investigations we have made we venture the assertion that some of the larger creameries lose from \$10 to \$30 daily during the season of greatest milk flow, from suffering fat to pass off in the skim milk and butter milk. We know that these figures are startling, but we believe that careful investigation would show them to be correct to the truth. The important question is, can this loss be avoided? From our study of the question during the past nine months we are inclined to believe that it can be avoided, it can be greatly reduced. During January and February, 1893, Mr. E. A. Leighton made study of the conditions necessary to the most thorough churning. He found that the temperature of the cream at the time of churning, the volume of cream, the character and condition of the cream as regards ripeness, seemed to be the controlling factors in thorough churning and on several different occasions he succeeded in churning with practically no loss of fat in the butter milk. The main difficulty seemed to be in securing the same conditions each day. It was, of course, an easy matter to secure the same temperature each day, and to place the same amount of cream in the churn; but the difficulty lay in determining when the cream was in proper condition as regards ripeness.—Farmers Review.

A WASHINGTON correspondent says: If there was to be an equal division of property in the United States, as some of the socialists recommend, each man woman and child would receive \$10,000 as his share, according to the valuation of the property in the country and personal property in the various states. In 1870 the total valuation was a little over \$7,000,000,000, or \$200 per capita of population. In 1891 it was \$16,000,000,000, or \$270 per capita. In 1892 it was \$18,000,000,000, or \$270 per capita. In 1893 it was \$20,000,000,000, or \$270 per capita. In 1894 it was \$22,000,000,000, or \$270 per capita.
