DAIRY AND POULTRY.

Some interesting particulars are given by Mr. F. C. Harrison, bacteriologist to the Guelph Experiment Station, in a description published by him of the great condensed milk business of Henri Nestle and Co., carried on by them at Vevey, Switzerland, and elsewhere. The article says: The milk supply is drawn from over 250 villages, but the firm does not buy from individual farmers. When the peasants wish to do business with the company they form into a co-operative society, and appoint one of their number as manager. They then sign an agreement which binds them to feed certain foods to their cattle, to keep their sheds and utensils clean, and to do many other things for the good of the milk. The manager arranges the terms, settles difficulties between. the community and the company, and exercises a general surveillance over his society. The Nestle, company have twenty-five inspectors, each with a horse and rig. whose duty is to drive continually from village to village, seeing that all is right and in good order. The inspector is always drawn from a remote village, has no association with the villages he calls at, and is selected for his vigilance and experience. The company also have their own veterinary surgeons, whose duty is to examine all milking utensils, and see that they are scrupulously clean, also that the byres are clean, well ventilated, and drained. The cows' diet is confined to hay and grass, and the inspector must see that no forcing foods, like oil cake, are used. Milk is transported in

ble. cans to the factory, and is there carefully weighed, sampled, and tested every day, to ensure that all cream is

The contents of all cans are then turned into a huge vat, where the milk remains until required for boiling. It is then run into a copper boiler and carefully scalded. Syrup cooked in another boiler to the right temperature and consistency is added, and the two are then mixed together. Next the milk is pumped into the condensers, and there condensed within a vacuum. The condition of the contents is ascertained by means of a tube attachment. which is rotated into the interior of the near the bottom and drawn out with a sample for examination. Condensation completed, the hot fluid is run out into cans to cool. To give an idea of the immense size of the ahead Nestle factories it is sufficient to say that they daily handle 26,000 gallons of fresh milk, the production of 15,000

present

There are other systems adopted in various parts, but the ones that we have given are the chief English once.

There is another by which it is claimed are can be kept fresh for a long time. and that is by dipping them into wax or parafine; but this is a tedious method, and one that involves much time and labor. The very best way of preserving eggi

is by freesing them, and this is the only way, we think, by which eggs can be kept quite fresh and good. Of course here are very few poultry keepers who are able to do this as very few possess

freezing chamber, and are thus able to freeze their exts. For this reason we have put it last, as to the ordinary Too much importance cannot be at ached to having the eggs perfectly tresh when they are put down, and unless they are in this state they will never keep. No egg should be put down that is more than twenty-four hours old, and even less than this is advisable As to whether fertile or infertile

oggs are the better for preserving, it is difficult matter to determine. We think-and several experiments that have been made so to prove it-that the infertile ones are the most suit-

Methods of Preserving Eggs. Doubtless some of our readers are interested in the question of preserving eggs. For such we publish the following from the London Rural World: The method most commonly in use is as follows: The eggs are placed in with the sheep. The trouble with the a large vessel or tub, holding large pig is that it is too much like a man; or small quantities, as the case may when it lies down and goes to sleep be, and these are all piled up, one on the top of the other. A preparation It sleeps just as soundly and snores composed of a mixture of five gallons of water with one gallon of fine slaked when an apple drops it doesn't hear it lime, to which about a gallon of salt or go for it until its sleep is out. The has been added, is made, and instinct of the worm teaches it to get when the water has dissolved out of the apple as quickly as possible as much lime as it can, it is after it drops. I have stood and poured over the eggs until they watched an apple after it struck the are entirely covered, keeping back any ground, and seen the worm come hustlime that may be at the bottom which | ling out in a hurry and go for some sehas not been dissolved. The eggs may cure place, and before the pig gets the be kept in this manner for a very long apple the worm is in some safe hiding period, but one drawback to this sys- place. Not so with the sheep; they tem is that the shells of the eggs be- never sleep so soundly but they will come so brittle that they break with hear an apple falling rods away, and the slightest touch. It is necessary to they are up and there before the worm

Put your mare on board the dians or of their ambush in his path boat, and tell your son-in-law to sell the mare as she is for what he can

"Returning to the original subject, just as soon as possible after getting a pair of goats once led a flock on a her to her destination.' long journey. A shepherd of Valencia It was a very shrewd way of getting

county, New Meixco, away from the few dollars from an honest, unsushome camp, had the misfortune to lose pecting, well-meaning man for an his dog through the attack of a mounanimal that looked fairly well, but tain lion and to break his leg on the was probably worth more to convert same day. Had the dog been alive he into fertilizer than for any other purcould have sent him to the home range pose. Men who advertise to pay from to summon assistance. As it was, he \$20 upwards per month for having ponies and horses boarded in the counwhile he dragged himself to the place try have very strong strings hitched to those animals. They use them as enticing bait for hooks thrown out to

catch country suckers. They find plenty of suckers who eagerly swallow the bait and part with their hard-earned dollars. The countrymen generally pay from four to ten times as much as a horse is worth, and invariably fail to secure the pony or horse as boarders, for which the party advertising offers to pay so liberally.

Poultry Briefs

Ground or cut bone is so useful to poultry raisers that it is something of a marvel that more bone cutters and grinders are not in use. The attempt to use commercial meals for freshly prepared bone can hardly be called a success; for the very obvious reason that the more useful of the products do not keep well in anything but the coldest weather. At some seasons of the year it is impossible to get beef meal, as the dealers will not handle it when it is likely to spoil on their hands. But the man that has a ma-

chine for reducing bone to edible size is independent. He can nearly always obtain bones that have on them much meat and these furnish a bone for supplying a little nitrogen and a good deal of lime and phosphorus. Around most homes bones have no use. Yet they can be made a source of valuable food supply.

The question is now being raised as to whether richness can be fed into eggs, and the amateurs are trying to demonstrate that it can be done. One man asserts very positively that his eggs are richer when he feeds very rich foods than when he feds foods not so rich. The trouble with this kind of evidence is that it is not exact. A man reports a thing as being so because he believes it is so, relying on his sense of taste. But, as with the question of feeding fat into milk, so here, appearances are not to be relied on.

Harvey Johnson of Iowa says: When our litters are of sufficient age to turn out we usually put two and sometimes three litters together in a pasture where there is a good warm and dry building and plenty of good grass. Near where the sows feed is a small enclosure with a low trough in it, and by a little persuasion and some tempting bits of food we expect to have the pigs feeding nicely at three to weeks of age. The feed is increased as their capacity for handling it is increased, but we are careful to underhave greatly improved and range stock | feed rather than overfeed-feeding no more at any time than they will eat clean. We allow them to run with the dams till they wean them, unless we wish to breed the sows again.
