Month supply of fuel oil stored for winter use

Verne Traudt, manager of utilities, said UNL has a one-month supply of fuel oil to run their steam power plant.

UNL has 1.15 million gallons of fuel oil to use if the natural gas supply to the University is cut. The power plant can burn 40,000 gallons

of fuel oil on a winter day. Traudt said UNL is on a standby natural gas basis, where the supplier can shut off the supply of natural gas at his option.

"UNL has been shut off more and more each year," Traudt said.

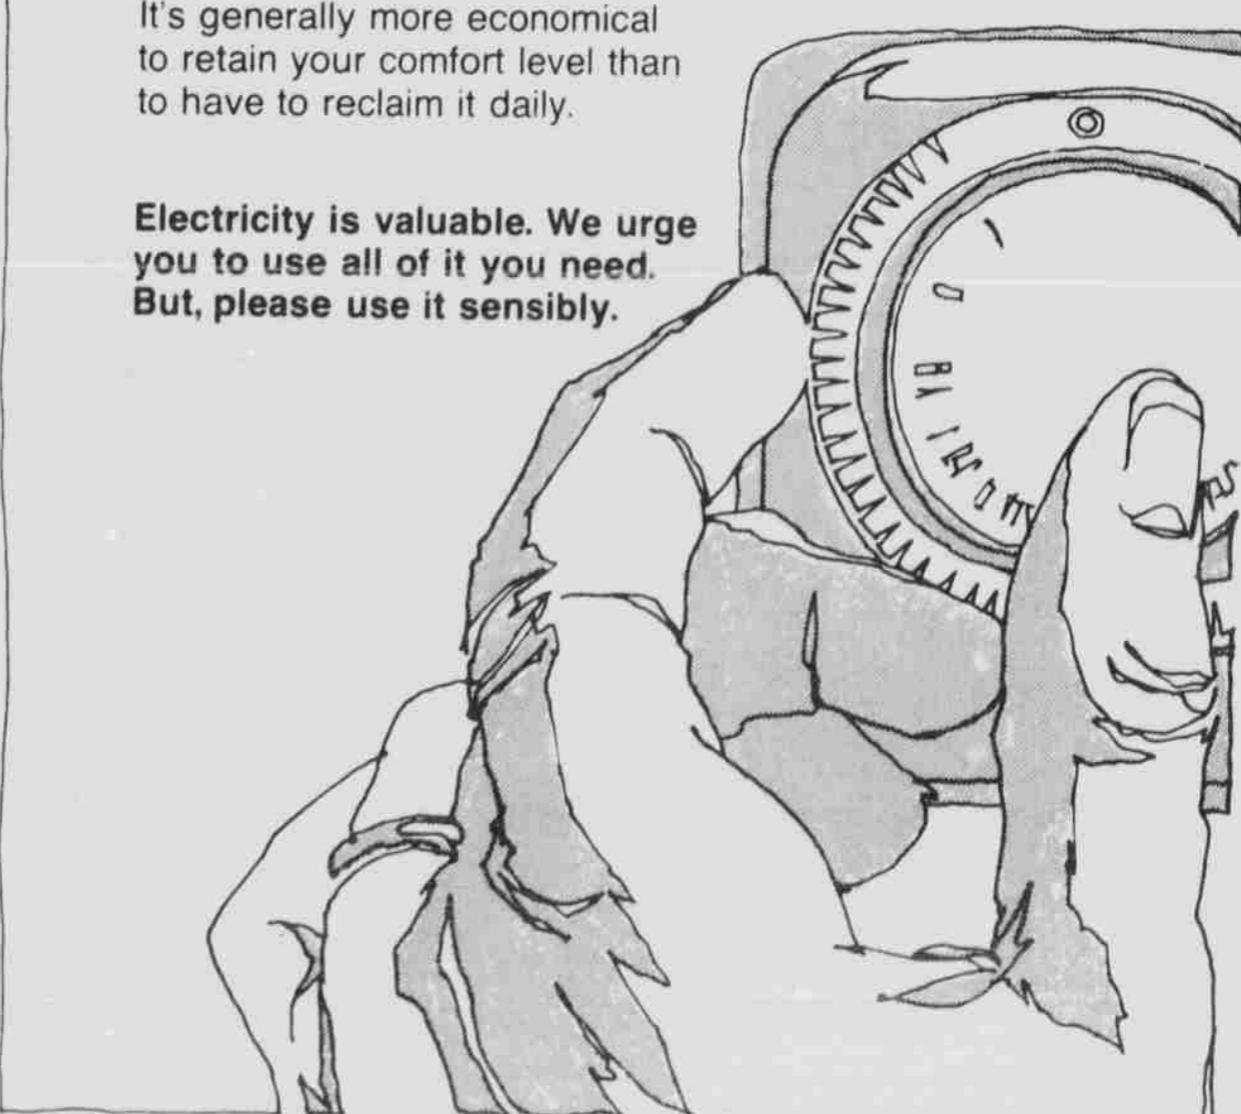

We care about conserving energy. Even though we're in the business of selling electrical energy, we don't like to see it wasted.

Here are some ways you can save electricity during the air conditioning season...

- Find a comfortable thermostat setting and don't change it. Every time you lower the setting, you raise the cost of operation. Operating your unit below 76° can cost you as much as 10% per degree.
- If you're going to be gone for several days, turn your air conditioning off. When you return, set it at your comfort level, not lower. A lower thermostat setting will not cool your house faster—it will simply make the air conditioner operate longer.

● Leave your air conditioner on at night. Studies show that a house, its walls, furniture and occupants begin to absorb heat when the sun rises and continue to do so all day. It's generally more economical to retain your comfort level than to have to reclaim it daily.

Lincoln Electric System

Electricity is valuable. We urge you to use all of it you need. But, please use it sensibly.
