

Research center an \$8 million investment

While officials consider ways to increase the number of Nebraska veterinary students taking doctorate work at other schools, \$8 million worth of construction is about to begin on the Animal Diagnostic and Research Center on East Campus, the assistant director of business and finance said Wednesday.

Ronald Wright said the center will consist of four buildings, one of which will be divided into four sections.

He said a veterinary diagnostic laboratory will be the first building constructed.

Wright said the Sampson Construction Company of Lincoln will build the diagnostic lab. The company's bid was made Aug. 22 and approved Sept. 7.

Working architectural drawings on the other three buildings will probably be bid in late winter or early spring, according to Wright.

Wright said plans for the other three buildings will be approved by the University's Central Planning and Development Committee before they are passed on for the approval of Chancellor James Zumberge and the NU Board of Regents.

The plans then will be presented to the State Building Division and the governor for final approval before any contracts are let.

Wright said the money was appropriated by the State Legislature last session on a cash-flow basis. He said this means the Legislature will distribute only the amount of money spent yearly on the construction. But Wright said the total \$8 million is guaranteed for the construction.

"Inflation could cause the university to ask the Legislature for supplemental funding," Wright said. "Because of the set appropriation, the buildings can't cost any more than that without a new request for funds.

"And with inflation, I don't think it will cost any less," he said.

Oliver D. Grace, a Veterinary Science professor, said the four buildings to be constructed are:

—A Basic Science Building which will include classrooms and office space.

—An Animal Research Building containing four sections with space for research and physiological study of cattle, swine and domestic animals, a cattle disease research section and laboratories.

—A small holding barn.

—The Veterinary Diagnostic Laboratory.

No One Under 18 EMBASSY THEATRE

As a British company we'd like to explain our 810 QX automatic turntable in plain English.

How the 810 QX reproduces recorded music accurately.

The BSR 810 QX has a sophisticated synchronous motor, spinning a heavy 7-lb. platter for accurate speed (regardless of voltage supply or record load) and all-but-nonexistent wow and flutter. Anti-skating force

may be adjusted for optimum pressure with either conical or elliptical stylus so stylus sits perfectly centered in groove for precise stereo

separation without audible distortion or uneven groove wear. A strobe disc is integrated into the platter design and a variable speed control is

provided should you want to vary from, and later return to, the normal speeds. The tone arm will track as low as 0.25 grams to make use of finest light-weight, high-compliance cartridges for maximum fidelity and dynamic range.

How the 810 QX protects records and cartridge stylus assembly.

Tone arm descent is viscous-damped in automatic operation and also when using the manual cue and

pause control, for gentle contact with record surface. Platter rubber mat protects records during play and cushions discs during automatic drop. Automatic spindle uses umbrella-type suspension without outboard balance arm. Stub spindle rotates with record to prevent distortion of center hole. Stylus setdown adjustment prevents stylus damage if dropped outside of entry groove range. Tracking pressure adjustable down to 0.25 grams for newest lightweight cartridges for minimum record

wear. Stylus brush whisks dust off stylus between plays. Lock automatically secures tone arm to prevent damage to stylus from accidental movement. Stylus wear meter records accumulated stylus use in hours. Knowing when

to replace a worn stylus

protects your records.

How the 810 QX provides convenient operation in any desired mode.

After touching a single feather-weight button, the 810 QX can either play a stack of records, shutting off after the last one; play a single record and shut off; or play a single record and repeat it indefinitely until you stop it.

Manual operation uses a single button to start the motor, and the cue control to lower the stylus.

How the 810 QX operates quietly, emitting no sound that can intrude on the music.

The 810 QX uses a unique sequential cam drive mechanism. It is a rigid

precision assembly that replaces the plumber's nightmare of rotating eccentric plates and interlocking gears that other changers use. Unlike other changers, there are no light metal stampings that can go out of alignment and make a lot of noise, from being carried, bumped, or just from use.
