6:17 p.m. — Minor fire reported at the College of Law on East Campus. Heat register motor reportedly burned.

11:03 p.m. — Theft reported from coin-operated machine in Andrews Hall.

Meteorologist to assist rain-barren countries

By Gene Gentrup

UNL professor Norman Rosenberg has been appointed to the U.S. delegation to the World Meteorological Organization's Commission on Agricultural Meteorology.

Rosenberg, an agriculture meteorologist, was appointed last month after serving 12 years as a part-time consultant for the commission.

Rosenberg said the main function of the WMO is to organize weather observation centers worldwide. The centers help meteorologists predict weather for other parts of the world and serve as a training center.

Rosenberg was one of three delegates appointed to the commission by Richard Hallgren, head of the National Weather Service.

Rosenberg said his appointment to WMO is a reflection of the important role Nebraska has in agriculture meteorology.

"The University of Nebraska has the strongest unit in the United States dealing with these subjects," he said.

The "unit" Rosenberg was referring to is the UNL Center for Agriculture Meteorology and Climatology. Rosenberg has been its director since 1979.

Rosenberg said the center was created from a sector of the agriculture engineering department.

"It was sort of a reorganization into a new department," he said.

Rosenberg said his duties as a U.S. delegate to WMO will include "weather proofing" less-developed countries by developing national weather services in those areas.

About 10 training schools around the world help less developed countries, he said. Countries like Niger, Morocco, Israel and Sicily have serious drought problems, which cut food production dramatically, he said, and West Africa is experiencing its worst drought and famine crisis of the century.

"The emphasis of our weather observation is food production," Rosenberg said. "We're helping these countries find better ways to use weather in agricultural production. Some crops are more suited to grow in dryer conditions."
