### WASTE TURNED TO PROFIT

Industrial Leaks of Other Days Converted Into Money Makers.

BY-PRODUCTS TAKE ON MANY FORMS

Chemical and Mechanical Skill Evolves Numerous Ways of Saving and Swells the Store of Human Conveniences.

One of the leading questions of the manu facturer in many lines today is not what he shall do with the thing, or things, which wastes of a great plant in the manufacturhis factory is equipped primarily to turn ing world may be the problem between out, but that other leading question, "What shall I do with the waste materials?"

It is the problem of the manufacturing age. It was suggested first in the conduct of the last crumbs of profit in his output of the Standard Oil company, when, un- in all probability is competing with a man expectedly to the first refiners of petroleum on a large scale, the immense volume of the | right side of the profit and loss account. waste product made itself apparent and called for diminution. The chemist was vanced for the profitable disposition of a a value. the best disposition of these waste products, as the vagaries of a dreamer. Today this the Standard company discovered that it refuse gives employment and profit to small might produce the refined oil and give it

MILLIN'S FOOD CO., BOSTON, MASS.

products of petroleum become. Long ago it was discovered that the tailings of the gold mine equipment of the '70s could be worked over with profit by the improved methods of the '90s. It came about with the age of electricity that, instead of searching for gold in copper bearing veins, the profit was greater to get out the copper and let the gold take care of itself as a by-product. Today the dust from the saw cutting through a cabinet wood is preserved, and, under hydraulic pressure, becomes the elaborate "carving" that afterward adorns panel, or drawer, or mirror frame.

From Bankruptey to Dividends. How to find a place and price for the dividends and bankruptcy. It is the tendency of the age to save in the small things and the man who is not availing himself or men who have solved the matter on the

onsulted, and it was not long until, with city's garbage would have been looked upon armies of workers. Bones, rags, glass, iron and paper are among the things sorted over and collected. Old tin cans are worked over for the tin in the first place, for the solder from the joints, and finally to go to the blast furnace for melting into pig iron. In Glasgow there are reduction plants for the inflammable residue, which turn out

Children's New Fall Coats

FOUR HOSIERY SPECIALS

BOYS' HOSE-In heavy wool and fleeced, worth up to 15c

Some of the high-priced perfumes upon the markets no doubt are made from the oils and ethers extracted from flowers, but many others of cheaper grade are produced from other and even ill-smelling substances. Fusel oil is one of the disagreeable and poisonous by-products of alcohol distillation, yet it enters in many of these perfume oils. Oil of pineapple is made from the action of putrid cheese on sugar. One of the most popular of perfumes comes from the drainings of cow houses, or at an even less cost from gas house tar. Our of the tar, too, comes the oil of hitter almonds, so much used in the scenting of

Wood from Sawdust. for the city 9,000 house-power in a ten-hour eral an artificial wood has been made day, this power going out for manufactur- through a combination of heat and hydraulic pressure which is promising for the era of the matter, separating the greases from many ways approaching the qualities of

the inferior soap making grades. The dried weight of the wood used has been obtained profit, together with the wool grease and residue is sifted through screens, where in sugar. Two hundred and twenty pounds resultant acids. In France 2,300 pounds of the bone, glass, iron and tin and like mat- of the wood have yielded as high as eight raw wool may yield "yolk" products val-

box material is made and chemical ele-

from wood are turned to various ac-

ounts. The products of the Chicago slaughte houses have been referred to more than almost any other of the gigantic waste materials of the country. Simply a listing of the by-products of the Chicago stock yards is suggestive enough of the value of the portions of the animals that once went into offal. These by-products are gelatine, glues, hair for plaster, curled hair for upholstery, bristles, blood, neat's foot oil, bones, horns, hoofs, soap stock, brewers' isinglass, albumen, hides, skin, wool, sausage casings, fertilizers, and the glands and membranes of animals from

Potash from Wool.

One of the interesting sources of valuable by-products is the wool of commerce as taken from the sheep's back. In pasturing close to the ground the sheep absorbs into his system a considerable amount of potash from the soil. This element is excreted with other matter through the skin and attaches to the wool. In some varieties of sheep these excretions, together with the dirt which adhere, may constitute two-thirds of the weight of the wool Itself. Even now much of this "suint" goes to waste in the wash waters, but in many centers of wool industry the potash and potash salts are recovered with

ued at M. 25 and yet costing less than 60 cents for the processes of extraction. In the United States five products of

evaporated to the consistency of sirup it clay and pottery products in the United One of these products is especially penetrating and softening and is used in oint- too, is one of the valuable by-products. Paper from the waste woods and waste ments and tollet compounds; another is products of wood leads all else in value a leather and belting dressing; another, from lumber residue. Once only the white freed of resinous substances, becomes a woods were regarded as of value for white lubricant; and another may lubricate other paper, but with the bleaching processes animal fibers to advantage in their workof the present there is no limitation of ing up. It has been estimated that \$3,000,color. Trees of the pine family, however, 000 worth of wool grease and potash runs work up more easily and economically, down streams in the United States every From these waste papers in turn paper year. Not only this, but it has been called three last are by-products, from which to mind that if this "suint" were saved its ments resulting from the making of paper by-product uses would increase, and instead of its being a loss it might represent a profit of \$15,000,000 annually.

Make Use of Cotton Seed,

Someone, writing of the cotton industry in the United States, has said of cotton growth of new industries and new methods seed that it "was a garbage in 1860, a cattle of manufacture the by-product will need to food in 1880, a table food and many things be considered and evolved. It promises to else in 1890." while it may be added for the be in all time one of the chief considerapresent year that the value of the seed of tions of the manufacturer.-Chicago Tribthe cotton plant is 21 per cent of the value | une. of all the cotton fiber. The prime product of the seed is the oil, yet in the oil cake is STRAIGHT TIP ON DIAMONDS to be found one of the most nearly perfect cattle foods. From the oil averaging 275 pounds to the ton of seed "pure olive oil" is made in vast quantities, lard has a vegwhich are taken pepsin, thymus, throids etable adulterant in it, salad dressings have it for a basis, soaps are made from the poorer grades of the oil, and in many respects the present methods of treating the waste seed product are more interesting and changeable than are the methods of manufacturing the fiber itself.

From leathers in manufactures little is allowed to go to waste in any way. Leather board is made from scraps. The more solid scraps are converted into heels for shoes. After scraps have been ground to a pulp they may be converted into "shoddy leathwhich is much used for the inner soles of boots and shoes. When such scraps are usable for no other purpose they go into the manufacture of glue,

the world not only some of the most ex- the market. With a flush supply from quisite of mineral dres, but the pharmacopein has been enriched by the medicinal lady and maid may be equally resplendent properties of this tar, which once was a in precious stones, and bartender, alderproblem as to its disposition. uct is likely. In the gas processes coke, Corn Products Utilized.

Almost five-sixths of the starch manufactured in the United States is made from corn, the daily maximum consumption being 180,000 bushels, yielding 2,500,000 pounds of starch and 4,000,000 pounds of glucose. From the kernel of the corn come the starch, germ, gluten and bran, of which the come corn oil and oil cake as chief values. From the stalk of the corn plant comes the cellulose, so valuable as a protection to vessels below the water line.

These are some of the contributions of by-products to the wealth and the mechanical necessities of the world. With the

Large Additions to the Stock in Sight Foreshadow a Fall in

Price. We may not be able to buy meat, but there is a prospect that we can all indulge in diamonds. This gratifying news comes straight from South Africa, where the output of the Premier mine promises to be all that heart could wish. It is only about eighteen months since this mine was dis covered and developed, yet it is found to be the largest individual diamond mine, and so far it has produced stones to the extent of one carat per load, which is a

higher result than is shown by any of the older mines. Of course this rich discovery is going to break the monopoly so long enjoyed by longer hold its prices or limit its output Coal tar from the gashouse has given to when a stronger rival is bent on flooding both the Premier and the De Beers mines

It is true that the De Beers diamond

older mines, yet in regard to the number of stones found and the size of the mine the Premier takes the lead. There is, however, the probability that the quality of the inferior diamond will be improved and placed on a par with what is now superior, Sir William Crookes lately read a paper before the British Royal society in which he wave the results of some of his experiments in determining the action of radium

on diamonds. Sir William found the diamond to be extremely phosphorescent in the presence of radium and that there was a change of color in the diamond varying according to the conditions to which it had been subjected. This color was sometimes darker, sometimes lighter. The scientist is of the opinion that this alteration of color may be of great commercial importance. he says, "off-color stones can be lightened their value will be increased, while if the prolonged action of radium is to communicate to them a decided color they would be worth much more as fancy stones."

Should diamonds become the easy possessions of every-day people it would not be the first time in history that stones once regarded as gems have suffered great depreciation in value. The price of precious opal has steadily declined since the discovery of the Australian fields, and topaz and amethyst by no means command the price of former days. Diamonds have always been regarded a good investment, but it begins to look as if they, too, may lose caste and pass into the realm of the com-
