Recent Progress Made in the Field of Electricity Wonders of Electricity. telephone is coming rapidly into use, and dropped into a hopper, whence they slide 200 kilometers apart, and distributed in rate of thirty-two words a minute. The THE current number of Suc- promises to carry the convenience of tele- through a conduit down into the active both directions to transformer substations. Atlantic cable resistance causes but a sec-

easy even for a layman to understand." he writes, "the superiority of electricity as houses." a motive power in urban and suburban transportation. With a locomotive, traction is secured from the weight of the driving wheels. With the multiple-unit system the weight of every car in the train may. a desired, be put upon the drivers. In service with frequent stops, speed is secured by a high rate of acceleration, and a rapid acceleration requires power and weight. In New York's new subway a train of eight cars will carry motors which may, at any desired moment, exert a tractive force equal to that of a half dozen large steam locomotives.

"Of great promise is the motor which uses an alternating current without sub-stasuccessful, it will introduce a large economy in all electrical railway operation. viens to all sorts of industrialism affords material for a book all by itself-ranging, as it does, from the great electrical locolady's hair by means of the magic current. In almost every workshop electrical tools may be found. In these and in compressed air appliances, may be found the greatest advance in shop-mechanics during the de- ing to the size of the coins. There is a new automatic or megovernment or postal relegraph instead of the times, postal telegraphy is imminent in America; it is demanded by progress, and

cess Walter Wellman reviews the phonic communication to hundreds of thou- mechanism, where they are pushed into a at a pressure of 100,000 volts. Another am- ond and a half or three-quarters' intermis various developments of electrical sands who cannot now afford it! The rural row. When the last coin has been forced bitious electrical scheme is in behalf of sion, and the highest speed it has is from power and the changes wrought telephone is growing at an amazing rate, into its place by a reciprocating push bar the Caucasian railway on the grounds that sixteen to seventeen words a minute. There thereby in industrial affairs, "It too, and already scores of thousands of the coins are automatically transferred electric traction is particularly adapted to the amplifier will save time, which, of American farmers have the 'phone in their from a buncher to the wrapper while a new a mountainous country and in the abun- course, means money. I have invented the

An Electric Coin Counter. Almost every one, from the millionaires down, has felt the necessity of making money quickly and easily, the counting of it being a matter of secondary importance. However, the coin of the realm was produced, whether in the form of bright copper pennies or \$1,000 gold certificates, it down to fate to object to counting them. Yet there are times and conditions when men long for a machine capable of counting their money for them. Hence, the electric motor coin counting and wrapping machine. The object of such a device is obviously to facilitate the rapid and accurate counttion transformers. If it proves entirely ing and bundling of coins of all descriptions, from pennies to dollars, since there are many lines of business which necessi-

ance of this laborious task. The machine counts and wraps coins at motive and the huge overhead crane to the the rate of seven coins every second, or 426 circumstances, particularly the lightness of brotting of a beefsteak or curling of my coins every minute, and does this continu- the rails and the insufficiency of water, ously as long as the motor runs and colns are fed into the hopper. The coins are their practical limit of speed, and though wrapped compactly at the rate of from eight to twelve bundles a minute, accord-

sole duty heretofore has been the perform-

FRESH FRUIT SPECIALS

Invention Annihilates Space.

Stephen Dudley Field, speaking of his new invention, the "amplifier," designed facilitate telegraphy, declares that by it the speed of ocean cabling may be doubled and its radius of action made unlimited, and that wireless telegraphy may be at once brought to commercial practica-

"I can hardly prophesy that my amplifier will revolutionize electrical message transmission," he continued, "but it certainly will bring all present known methods to the limit of perfection, and, of course, to greater usefulness. For instance, it will make it almost as easy to send a message from London to Shanghai, more than 10,000 miles, as to send it from Stockbridge to Great Barrington, less than ten miles. Great inconvenience is now experienced in cabling from the outside causes, which affect the electrical current. The amplifier records variations in current only, and with it the cable may be used even if the electrical strength should vary from its unit to its hundredth part.

coils and magnets, trussed on spun glass ations in intensity, and, though the curthreads one-thousandth of an inch in size, rent be so attenuated that we can discover works the same with one hundred-thous- the signals vo other way, the amplifier andth of an ampere as with a one-thousandth-ampere current. I have sent, by it. By means of it I can receive cable or means of the amplifier, messages through wireless messages on paper tape, using the

way to cheapen all electrical message tolls, but the cheapening does not lie with me, however.

"The amplifier practically annihilates terrestrial space. It does this by joining together any system of telegraphy or cabling so that a continuous message may be sent completely around the earth without repeating or interruption. This is possible even though wireless systems and land lines and ocean cables be all joined together. With a bit of perfecting I don't doubt I could combine it to include telephone systems as well.

"I believe it to be perfectly possible that by the use of an improved amplifier one would be able to talk over the tele phone around the world. All this would necessitate the use of an amplifier at every station which marks the present limit of telegraphing or telephoning, by whatever way, without repeating.

"When the current gets so weak from ong travel that one could not read the telegraphic clicks by sound or hear a hu man voice, the amplifier will pick out the variations in tone and automatically retransmit them through new battery powers with renewed vigor without human aid. If it be possible to send photographs by telegraphy from Philadelphia to New York the amplifier will permit it from New York around the world. The same with seeing by telephone. If that is ever possible for a short distance the amplifier will make it perfect throughout the earth "The amplifier is simply a mechanical

"The amplifier, with its system of wire microscope. It reads and records all variprogress cannot be denied. The automatic to fadilitate examination, when they are be generated at power stations from 100 to seconds to transmit the agnals at the has been sought after for many years."
