METEORITE BY A DENTED Great Hole in the Ground in Arlzona Explored and Explained by

Geologists.

In Coconino county, Arizona, about five les south of Sunshine Station, on the Santa Fe railroad, is a very remarkable eminence rising above an almost perfectly level plain and known locally as Coon Buite or Coon Mountain.

This so-called mountain consists of a circular ridge from 130 to 160 feet in height. surrounding an almost circular depression a the earth about 400 feet deep and approximately three-fifths of a mile in diameter. From the bottom of the depression to the creat of the ridge surrounding it the distance is from 530 to 560 feet.

The depression has a general resemblance is a crater, and a superficial glance conveys the impression that it was really the natural sciences. Philadelphia, has just contain iron, nickel, unidium and platinum. rater of a volcano which became extinct eges ago. Geologists, however, soon observed that the rim around the orater-like of the theory that this great hole in the less unsurmountable difficulties are met, it depression is not composed of volcanic outfrom twenty to forty feet of red mandstone, then from 250 to 350 feet of yellowish lime-

rminates. These same level strata, formed when and almost impaipable dust, of which a miles. The theory that the so-called crater slivers by the terrific force of the collision. could have been formed by a volcano may be set aside as impossible.

Another theory was that this remark- depth, but no large plece has yet been abla hole was the result of a steam explosion, but the latest investigators have the other hand, about fifteen tons of the found many reasons for believing that this meteoric iron have been collected from explanation is incredible.
